Cooperation with U.S. Bureau of the Census

Under the legislation authorizing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies.

In accordance with specifications established by the National Center for Health Statistics, the U.S. Bureau of the Census, under a contractual arrangement, participated in planning the survey and collecting the data.

Current Estimates From the National Health Interview Survey, 1990

by Patricia F. Adams and Veronica Benson,
Division of Health Interview Statistics

Introduction

This report on the 1990 civilian noninstitutionalized population residing in the United States presents estimates of acute conditions, episodes of persons injured, restriction in activity, prevalence of chronic conditions, limitation of activity due to chronic conditions, respondent-assessed health status, and the use of medical services—including physician contacts and short-stay hospitalization.

Estimates of these health characteristics are presented in detailed tables for various groups in the population, including those defined by age, sex, race, and family income (each shown for specific age groups), and by geographic region and place of residence. Estimates for other characteristics of special relevance to particular health measures are also included. For instance, estimates of physician contacts are shown by the place where the contact occurred.

The text includes a brief definition of each of the health characteristics included in the detailed tables and reports the 1990 estimate for each characteristic. Text tables include the corresponding 1988 and 1989 estimates for each of the major health characteristics. Various technical matters associated with the National Health Interview Survey (NHIS) data collection procedures and with the presentation of results are described in the remainder of the report.

In 1982, the NHIS questionnaire and data preparation procedures of the survey were extensively revised. The basic concepts of NHIS changed in some cases; in other cases the concepts were measured in ways that differed from previous surveys. Comparisons with earlier results should not be undertaken without having carefully examined the nature of these changes. Further explanation of these changes can be found in appendix IV of Series 10, No. 150 (1).

In 1985, a new sample for NHIS and a different method of presenting sampling errors were introduced. Therefore, the technical material is of unusual importance to readers accustomed to using data from NHIS prior to 1985.

Although published reports are the primary vehicle for disseminating estimates from NHIS, data are also available in the form of standardized microdata tapes that include the regular characteristics of each year's survey from 1969 through 1990. Questions pertaining to the cost and availability of these tapes should be directed to the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. Public use tapes are also available for special topics included in NHIS from 1973 through 1990. The special topics studied in 1990 covered six areas: (a) assistive devices (including use of special equipment for persons with disabilities or impairments, frequency of use, method of payment, and health conditions causing its use); (b) hearing (including hearing function and age of onset of hearing problems); (c) podiatry (including how long foot problems lasted, whether professional treatment was sought, why treatment was not obtained, type of health professional seen, and whether treatment was covered by insurance); (d) income (including health insurance coverage, employment status, type of pension received, public assistance and other sources of income); (e) health promotion and disease prevention (including pregnancy and smoking, general health habits, injury control and child safety and health, cardiovascular disease, mammography, radon, stress, exercise, smoking, alcohol use, and dental care); and (f) knowledge and attitudes about acquired immunodeficiency syndrome (AIDS), including sources of AIDS information, self-assessed level of AIDS knowledge, basic facts about the AIDS virus and how it is transmitted, blood donation experience, awareness of and experience with the blood test for the AIDS virus, self-assessed chances of getting the AIDS virus, personal acquaintance with persons with AIDS or the AIDS virus, willingness to take part in a proposed national seroprevalence survey, and a general question on AIDS risk behaviors. Information on tapes relating to special topics is available from the National Center for Health Statistics, Division of Health Interview Statistics, Systems and Programming Branch, 6525 Belcrest Road, Hyattsville, MD 20782.

Source and limitations of data

The information from the National Health Interview Survey (NHIS) presented in this report is based on data collected in a continuing nationwide survey by household interview. Each week a probability sample of the civilian noninstitutionalized population of the United States is interviewed by personnel of the U.S. Bureau of the Census. Information is obtained about the health and other characteristics of each member of the household.

The 1990 NHIS was conducted with a full sample. The interviewed sample for 1990 was composed of 46,476 households containing 119,631 persons. The total noninterview rate was 4.5 percent; 2.7 percent was the result of respondent refusal, and the remainder was primarily the result of failure to locate an eligible respondent at home after repeated calls.

In 1985, although several new sample design features were adopted for NHIS conceptually, the sampling plan remained the same. The major changes included (a) reducing the number of primary sampling locations from 376 to 198 for sampling efficiency, (b) oversampling the black population to improve the precision of the statistics, (c) subdividing the NHIS sample into four separate representative panels to facilitate linkage to other National Center for Health Statistics (NCHS) surveys, and (d) using an all-area frame not based on the decennial census to facilitate NCHS survey linkage and to conduct NHIS followback surveys. A description of the survey design, the methods used in estimation, and general qualifications of the data obtained from the survey are presented in appendix I.

Because the estimates presented in this report are based on a sample of the population, they are subject to sampling errors. Therefore, readers should pay particular attention to the section of appendix I entitled "Reliability of the estimates," which presents formulas for calculating standard errors and instructions for their use.

All information collected in the survey results from reports by responsible family members residing in the household. When possible, all adult family members participate in the interview. However, proxy responses are accepted for family members who are not at home, and are required for all children and for family members who are physically or mentally incapable of responding for themselves. Although a considerable effort is made to ensure accurate reporting, the information from both proxy respondents and self-respondents may be inaccurate because the respondent is unaware of relevant information, has forgotten it, does not wish to reveal it to an interviewer, or because the respondent does not understand the intended meaning of a question.

The major concepts for which estimates are shown in this report are defined in appendix II. Appendix III includes a copy of the questionnaires and flashcards used in the interview. Illnesses and injuries are coded using a slight modification of the ninth revision of the *International Classification of Diseases* (2). The Division of Health Interview Statistics of NCHS should be contacted for information about coding and editing procedures used to produce the final data file from which the estimates shown in this report are derived.

Highlights for 1990

In the following sections, each of the health-related characteristics included in this report is defined, and the 1990 estimate is compared with the 1988 and 1989 estimates (3,4) for the same characteristic. The comparisons are highlighted in text tables, which also include the standard error for each of the 1990 estimates. The reader who wants some idea of how much difference there must be between the 1988, 1989, and 1990 estimates to constitute a statistically significant difference may use the standard errors to calculate a confidence interval or a critical value for the *t*-test. Of these two methods, the *t*-test (with a 95-percent level of significance) has been used in the following discussion as a basis for making statements about the difference or lack of difference between the 1988, 1989, and 1990 estimates.

Because the text compares only the overall rates or percents of health-related characteristics between 1988 and 1990, and the age distribution of the civilian noninstitutionalized population does not change greatly over a 3-year period, the possible effect of differing age distributions is not discussed in the text. Tables A–D include age-standardized as well as unstandardized figures, and the 3-year trends are similar.

Readers using the detailed tables who wish to make comparisons of subgroups of the population may want to consider the possible effect of age in comparing subgroups. For those sociodemographic characteristics for which the age distribution of the subgroups differs to a significant degree (such as for sex, age, and family income), the results are shown for specific age groups. However, in the case of geographic region and place of residence, there is little difference in the age distributions of the subgroups; therefore, these results are not shown for specific age groups.

The detailed results for health characteristics are shown in tables 1–77. Table 78 shows the population used to calculate the unstandardized rates used in this report. The age-standardized data presented in text tables A–D employ the 1980 civilian noninstitutionalized population of the United States as a standard population. Age-specific rates for six age groups (0–4, 5–17, 18–24, 25–44, 45–64, and 65 years and over) were directly standardized to produce these estimates.

Acute conditions: Incidence, medical attention, and associated restriction in activity

An acute condition is defined for the National Health Interview Survey (NHIS) as a type of illness or injury that ordinarily lasts less than 3 months, was first noticed less than 3 months before the reference date of the interview, and was serious enough to have had an impact on behavior. Only two types of impact are considered: first, whether the illness or injury caused the person to cut down for at least half a day on the things he or she usually does or, second, whether a physician was contacted regarding the illness or injury.

Incidence

Tables 1–5 show the incidence rate and tables 6–10 the incidence of acute conditions by type of condition and sociodemographic characteristics. The 1990 rate of 171.6 acute conditions per 100 persons per year does not significantly differ from 1988 or 1989 (175.3 and 181.3, respectively) (table A).

For broad types of acute conditions, the 1990 incidence rates per 100 persons per year rank as follows: respiratory conditions (85.3), injuries (24.4), infective and parasitic diseases (21.0), and digestive system conditions (5.3). The rates for injuries, infective and parasitic diseases, and digestive system conditions are similar to the rates for 1988 and 1989. The 1990 estimate for respiratory conditions (85.3) is lower than the rate for 1989 (95.2) but is similar to the 1988 rate (86.9). The incidence rate of influenza for 1990 (43.4) is lower than the 1989 rate (50.4) but about the same as that observed in 1988 (42.8).

Medical attention

Tables 11–15 show estimates of the percent of acute conditions that were medically attended. The 1990 estimate of 63.4 percent (table A) is slightly higher than the rate observed in 1989 (61.6) but similar to the 1988 rate (62.8).

Table A. Acute conditions measures: United States, 1988–90

Acute condition measure	Unstandardized				Age standardized		
	1988	1989	1990		1988	1989	1990
			Estimate	Standard error			
Annual incidence of acute conditions	Number per 100 persons per year						
All acute conditions	175.3	181.3	171.9	4.0	177.2	183.4	174.5
Infective and parasitic diseases	22.3	20.1	21.0	0.9	23.0	20.7	21.9
Respiratory conditions ¹	86.9	95.2	85.3	2.3	88.0	96.6	86.7
Common cold	28.5	29.1	25.0	1.0	28.9	29.4	25.3
Influenza	42.8	50.4	43.4	1.4	43.3	51.2	44.1
Digestive system conditions	6.3	5.9	5.3	0.4	6.3	5.9	5.4
Injuries	24.6	24.3	24.4	1.0	24.8	24.4	24.7
Other acute conditions	35.2	35.8	35.9	1.2	35.1	35.8	35.8
Acute conditions medically attended	Percent						
All acute conditions	62.8	61.6	63.4	0.6	61.6	60.6	62.4
Restricted activity associated with acute conditions	Number of days per 100 persons per year						
All restricted-activity days	699.5	749.1	704.9	17.1	699.8	748.4	703.5
Bed days	303.7	344.1	306.4	9.6	305.1	345.4	307.8
Work-loss days ²	311.4	336.5	317.3	11.1	302.0	343.4	314.5
School-loss days ³	405.9	463.5	378.9	18.8	---	---	---
Quarterly incidence of acute conditions	Number per 100 persons per quarter						
January 1–March 31	60.2	65.9	56.1	1.7	---	---	---
April 1–June 30	36.9	33.3	34.6	1.2	---	---	---
July 1–September 30	30.2	31.0	32.0	1.1	---	---	---
October 1–December 31	48.0	51.1	49.3	1.5	---	---	---

¹Includes other acute respiratory conditions.²For currently employed persons 18 years of age and over.³For youths 5–17 years of age.

NOTE: Detailed tables show the 1990 estimates by age, sex, race, family income, geographic region, and place of residence.

Restricted activity associated with acute conditions

Four types of restricted activity resulting from illness, injury, or impairment are measured in NHIS: days lost from work for currently employed persons 18 years of age and over, school days missed by youths 5–17 years of age, days spent in bed (which may overlap either of the preceding types), and other days on which a person cut down on the things he or she usually does. Estimates of “cut-down” days are not presented separately but are included in the generic concept of “restricted-activity days.” The other three types of restricted activity also included in the generic concept “restricted activity” are usually shown separately in reports from NHIS.

A person may restrict his or her activity on a given day as a result of more than one condition; these conditions may be acute or chronic. “Restricted activity associated with acute conditions” includes days on which only one acute condition or more caused the activity restriction; it also includes days on which one acute condition or more and one chronic condition or more caused the activity restriction. In the latter case, because the restriction in activity was the result of both acute and chronic conditions, the cause cannot be attributed solely to an acute condition. For this reason, the words “associated with” rather than “caused by” are used to describe this type of estimate.

Tables 16–20 show the incidence rate and tables 21–25 show the incidence of restricted activity associated with acute conditions by type of condition and sociodemographic characteristics. The 1990 rate per 100 persons per year of restricted-activity days (704.9) is similar to those in 1988 and 1989 (699.5 and 749.1, respectively) (table A). The rate of bed days for 1990 (306.4) is lower than the 1989 rate of 344.1 but similar to the rate for 1988 (303.7). The rate of work-loss days for currently employed persons 18 years of age and over (317.3) does not significantly differ from the corresponding rates for 1988 (311.4) and 1989 (336.5). The rate of school-loss days for youths 5–17 years of age was lower in 1990 (378.9) than in 1989 (463.5) but is similar to the 1988 rate (405.9). Tables 26–49 show the detailed rates and frequencies for bed days (tables 26–35), work-loss days (tables 36–45), and school-loss days (tables 46–49).

Incidence by quarter

The 1990 incidence rate and incidence of acute conditions by quarter are shown in table 50. As may be noted in table A, the estimated rate for the first quarter of 1990 (56.1) is lower than the comparable rate for 1989 (65.9) but similar to the 1988 rate (60.2). For the second, third, and fourth quarters, the 1990 rates are similar to those for 1988 and 1989, the differences not exceeding what might be expected from sampling variability.

Episodes of persons injured

Injury data may be analyzed in three possible units: (a) the number of injuries sustained in a particular episode involving injury, (b) the number of episodes involving injury during a given period of time, or (c) the number of persons involved in one episode or more in which injury occurred during a period of time. The estimates of injuries included in tables 1–50 are of the number of injuries that occurred during 1990. This section considers the number of episodes that occurred during 1990 that involved one injury or more. Because of the short reference period used to collect injury data in NHIS (2 weeks), the data cannot be used to estimate the number of persons involved in one episode or more of persons injured during any given year.

Table 51 shows the incidence rate of episodes of persons injured and table 52 the incidence of such episodes by sociodemographic characteristics, by whether a moving motor vehicle was involved (and if so, whether this occurred in traffic), by where the episode occurred, and, for persons 18 years of age and over, by whether they were working at a job or business at the time the episode occurred. The 1990 rate of episodes of persons injured per 100 persons per year (23.8) is almost identical to the 1988 and 1989 rates of 24.0 and 23.8, respectively (table B).

Restricted activity associated with injury and impairment due to injury

An injury may have health-related effects for many years after its occurrence, or, for that matter, even for a lifetime. (This might be the case, for instance, for a person who suffered a dislocated back due to an accident.) The estimates of activity restriction in tables 53 and 54 and of bed days in tables 55 and 56 are based on the present effects of injuries no matter when they occurred. Thus, these estimates include the days shown in earlier tables for acute injuries and also include days of restricted activity during 1990 that are attributable to the effects of injuries suffered prior to 1990. In many cases these old injuries have become impairments, and any restricted activity during 1990 that was caused by an injury-related impairment is also included.

The 1990 rates for restricted-activity day (273.1) and bed days associated with episodes of persons injured (273.1 and 84.2 per 100 persons per year, respectively) appear to be higher than the 1988 and 1989 rates; however, the differences are not statistically significant (table B).

Prevalence of reported chronic conditions

Chronic conditions are defined as conditions that either (a) were first noticed 3 months or more before the reference date of the interview or (b) belong to a group of conditions (including heart disease and diabetes) that are considered chronic regardless of when they began. For the purpose of estimating the prevalence of reported chronic conditions, the NHIS sample is divided into six representative subsamples: respondents in each subsample are administered one of six checklists of types of chronic conditions. Respondents are asked to indicate the presence or absence of each condition specified on the particular list administered to them. Because the presence or absence of many types of chronic conditions is often difficult to ascertain, several “impact” questions are asked about each condition reported. Information is elicited on whether the person has been hospitalized for the condition and the number of days he or she stayed in bed because of the condition during the 12 months prior to the interview.

Totals for all chronic conditions are not shown because NHIS does not measure the total number of chronic conditions for each person. It also should be noted that a person may have more than one chronic condition; therefore, the sum of conditions that are counted may exceed the sum of persons having those conditions.

Tables 57–61 show the prevalence rate and tables 62–66 the prevalence of selected chronic conditions. As may be noted in table 57, the reported conditions with the highest prevalence rates were sinusitis, arthritis, deformity or orthopedic impairment, and hypertension (with rates per 1,000 persons of 131.3, 125.3, 117.4, and 110.2, respectively).

The 1990 estimates of the number and rate of persons with hearing impairments and tinnitus are considerably

Table B. Episodes of persons injured and associated restrictions in activity: United States, 1988–90

Episodes of persons injured and associated restricted activities	Unstandardized				Age standardized		
			1990				
	1988	1989	Estimate	Standard error	1988	1989	1990
Episodes of persons injured	Number per 100 persons per year						
All types of injury	24.0	23.8	23.8	1.0	24.2	23.9	24.1
Restriction in activity associated with episodes of persons injured							
All restricted-activity days ¹	251.7	258.7	273.1	8.9	245.9	250.9	257.1
Bed days	72.6	78.9	84.2	4.5	70.1	76.3	83.1

¹Includes work-loss and school-loss days as well as bed days.

NOTE: Detailed tables show the 1990 estimates by age, sex, race, family income, geographic region, and place of residence.

higher (15.1 percent and 21.9 percent, respectively) than the corresponding estimates for 1989. The 1990 NHIS, unlike the 1989 NHIS, included a special set of questions on hearing impairment. When special questions on any condition are included, reporting of the condition tends to be more complete, which probably is the main cause of the higher estimates of hearing impairments and tinnitus in 1990.

Limitation of activity due to chronic conditions

The concept of limitation of activity used in this report refers to long-term reduction in activity resulting from chronic disease or impairment. The measurement of this concept in NHIS permits one to distinguish among (a) persons unable to carry on their usual activity, (b) persons limited in the amount or kind of their usual activity, (c) persons limited but not in their usual activity, and (d) persons not limited. The category of persons limited in their major activity includes those in the first two groups, that is, those unable to carry on the usual activity for their age-sex group, whether it is working, keeping house, going to school, or living independently, and those restricted in the amount or kind of usual activity for their age-sex group. Persons limited, but not in their major activity, include persons restricted in other activities such as civic, church, or recreational activities.

The 1990 estimate of the percent of persons limited in activity due to chronic conditions (13.7) is not significantly different from the 1988 or 1989 estimates (table C).

Likewise, the estimates of persons limited in their major activity (categories (a) and (b) discussed in the previous paragraph) are similar for 1988, 1989 and 1990 (9.4, 9.6, and 9.3, respectively).

The detailed percent distributions and frequencies for limitation in activity are shown by sociodemographic characteristics in tables 67–68.

Restricted activity due to acute and chronic conditions

Earlier in this report estimates of restricted-activity days associated with acute conditions were shown (tables 16–49) and the relationship between the types of restricted-activity days was discussed. The estimates shown in table 69 are for days of restricted activity per person caused by acute or chronic conditions, or both.

As may be noted in table C, the 1990 rate per person per year of restricted-activity days (14.9) is similar to the corresponding rates for the 2 previous years. The differences observed between the 1990 rates for bed days (6.2) and work-loss days for currently employed persons 18 years of age and over (5.3) and those for 1988 and 1989 are within sampling variation. The 1990 rate for school-loss days for youths 5–17 years of age (4.6) is lower than the corresponding rate for 1989 (5.7) but similar to the 1988 rate of 4.9.

The detailed estimates for each type of restricted-activity day are shown by sociodemographic characteristics in table 69.

Table C. Health status measures: United States, 1988–90

Health status measure	Unstandardized				Age standardized		
	1988	1989	1990		1988	1989	1990
			Estimate	Standard error			
Restricted activity due to acute and chronic conditions			Number of days per person per year				
All restricted-activity days	14.7	15.2	14.9	0.3	14.4	14.9	14.6
Bed days	6.3	6.5	6.2	0.2	6.2	6.4	6.1
Work-loss days ¹	5.3	5.6	5.3	0.1	---	---	---
School-loss days ²	4.9	5.7	4.6	0.2	---	---	---
Limitation in activity due to chronic conditions			Percent				
All persons limited in activity	13.7	14.1	13.7	0.1	13.4	13.7	13.3
Persons limited in major activity	9.4	9.6	9.3	0.1	9.3	9.4	9.1
Respondent-assessed health status			Percent distribution				
All health statuses ³	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Excellent	39.1	39.7	39.5	0.3	39.5	40.1	40.0
Very good	27.8	28.1	28.6	0.2	27.8	28.0	28.6
Good	23.2	22.6	22.5	0.2	23.0	22.4	22.3
Fair	7.2	7.0	6.9	0.1	7.1	6.8	6.6
Poor	2.7	2.6	2.6	0.1	2.6	2.5	2.5

¹For currently employed persons 18 years of age and over.

²For youths 5–17 years of age.

³Excludes a small number with unknown health status.

NOTE: Data on tables show the 1990 estimate by race, sex, age, geographic region, and place of residence.

Respondent-assessed health status

Data on assessed health status result from simply asking respondents to assess their own health or that of family members living in the same household as excellent, very good, good, fair, or poor. Table 70 shows the percent distribution for these categories according to sociodemographic characteristics. The health of most persons in the civilian noninstitutionalized population is assessed as "excellent" (39.5 percent) or "very good" (28.6 percent). Only 2.6 percent are assessed as "poor" (table C). Overall, the 1990 estimates for the health status categories show respondents assessing health the same way they did in 1988 and 1989.

Physician contacts: Rate and interval since last contact

A contact is defined as a consultation with a physician, in person or by telephone, for examination, diagnosis, treatment, or advice. The visit is considered a physician contact if the service is provided by the physician or by another person working under the physician's supervision.

Annual rate

Table D shows the rates of physician contacts reported for 1988–90. The 1990 rate of 5.5 doctor visits per person per year is almost identical to the rates for 1988 (5.4) and 1989 (5.4).

Aside from the sociodemographic characteristics, the rates and frequencies also are shown by the place of contact in table 71. The rate is highest for doctor's office (3.3 per person per year) and is less than one contact per person per year for each of the other places mentioned (telephone, hospital, and other).

Interval since last contact

Table 72 shows the percent of the civilian noninstitutionalized population by interval of time since the person last had a physician contact. Whereas the estimates for the rate of physician contact do not include contacts while a person was an overnight patient in a hospital, such contacts are included in the definitions of the interval since a person last saw or talked to a physician or a physician's assistant.

Table D indicates that during 1990 an estimated 77.9 percent of the civilian noninstitutionalized population had contact with a physician during the year preceding interview. This estimate is similar to the 1988 and 1989 estimates (76.7 and 77.4, respectively).

Other estimates of ambulatory medical care services by physicians are provided by data from the National Ambulatory Medical Care Survey, a probability sample survey conducted periodically by the Division of Health Care Statistics of the National Center for Health Statistics. A summary of 1989 survey results, the most recent available, is found in *Advance data from vital and health statistics*, No. 203 (5).

Hospitalization: Episodes and days for persons; discharges and average length of stay

Respondents in NHIS are asked to describe any hospitalizations during the year preceding the interview that involved at least a 1-night stay. Two of the measures obtained through this series of questions are the number of times and number of days spent in short-stay hospitals in the 12 months prior to the interview. Because persons who died or were institutionalized in a given reference period are not included in NHIS, the rates and frequencies shown in this report will vary from those based on all overnight patients who entered a short-stay hospital during any given period of time. The difference will be especially great for older persons.

Table D. Health care utilization: United States, 1988–90

Health care utilization	Unstandardized				Age standardized		
	1988	1989	1990		1988	1989	1990
			Estimate	Standard error			
Physician contact				Number			
Contacts per person per year	5.4	5.4	5.5	0.1	5.3	5.3	5.4
				Percent			
Persons with 1 contact or more in past year	76.7	77.4	77.9	0.4	76.6	77.1	77.6
Hospitalization							
Persons with 1 hospital episode or more in past year	8.2	8.1	7.9	0.1	8.0	7.9	7.7
				Number			
Hospital days per person hospitalized in past year	8.0	8.0	8.0	0.3	7.8	7.7	7.6
Discharges per 100 persons per year	11.2	11.3	11.0	0.2	11.0	11.0	10.8
Average length of stay per discharge in days	6.3	6.5	6.3	0.5	6.1	6.6	6.6

NOTE: Detailed tables show the 1990 estimates by age, sex, race, family income, geographic region, and place of residence.

Estimates on hospitalization are presented in two forms: episode estimates and discharge estimates. Episode estimates focus on the person's hospital experience during the 12 months preceding the interview. The tables showing these estimates classify people on the basis of whether they were hospitalized during the reference period and, if so, the number of times they were hospitalized. Discharge estimates focus on hospital stays as the unit of analysis rather than on persons.

Hospital episodes and days

Tables 73 (percent distribution) and 74 (frequency) show the distribution of short-stay hospital episodes including and excluding deliveries by the number of times a person was hospitalized during the year preceding the interview and sociodemographic characteristics. The category "delivery" is based on the reason the woman entered the hospital or whether surgery related to delivery was performed. The percent of persons in 1990 with one hospital episode or more during the year preceding the interview is 7.9 percent (table D). This is similar to the estimates for 1988 (8.2) and 1989 (8.1). The 1990 rate is about 23 percent lower than the 1982 estimate of 10.3 percent (1).

Associated with the number of times a person was a patient in a short-stay hospital during the year preceding the interview is the total number of days (strictly speaking, nights) the person spent as a patient in the hospital. Table D shows that in 1990 persons with one hospitalization or more spent an average of 8.0 days in the hospital in the year preceding the interview. This rate is the same for 1988 and 1989. Tables 75 and 76 show the estimated rate and number of hospital days by the number of times people were hospitalized (including and excluding deliveries) and sociodemographic characteristics.

Hospital discharges and average length of stay

Table 77 shows the rate and number of hospital discharges, the average length of stay, and the number of

hospital discharge days by sociodemographic characteristics and by whether a delivery was involved in the hospitalization. Based on data collected during 1990, there were 11.0 discharges per 100 persons and the average length of stay per discharge was 6.3 days. Both of these rates are similar to the 1988 and 1989 estimates of discharges per 100 persons (11.2 and 11.3, respectively) and days per discharge (6.3 and 6.5, respectively).

Examining longer term trends, the 1990 hospital discharge rate of 11.0 is 23 percent lower than the rate estimated by NHIS in 1981 (14.2), and the average length of stay is about 15 percent lower than in 1981 (7.4) (6).

This finding probably reflects the following two phenomena: (a) some medical procedures (once performed as inpatient hospital care) are now handled in outpatient medical facilities, and (b) the Health Care Financing Administration (which operates the Medicare program), some States, and some third-party payers now reimburse hospitals for inpatient care using a preestablished payment schedule based on patients' diagnosis-related groups.

Information also is collected on hospital discharges from hospital records through the National Hospital Discharge Survey (NHDS) conducted by the National Center for Health Statistics. Estimates from NHDS, published in Series 13 of *Vital and Health Statistics*, are somewhat higher than those presented here because of differences in collection procedures, population sampled, and definitions used. NHDS has experienced a recent decline in its hospital discharge rates, and NHDS estimates of average length of stay for older persons also are declining. Thus, the data from the two surveys are consistent. The most recent national estimates of short-stay hospitalization based on NHDS are summarized in *Advance data from vital and health statistics*, No. 199 (7).

List of detailed tables

Incidence of acute conditions

Rates

1. Number of acute conditions per 100 persons per year, by age and type of condition: United States, 1990 . . .	13
2. Number of acute conditions per 100 persons per year, by sex, age, and type of condition: United States, 1990	14
3. Number of acute conditions per 100 persons per year, by race, age, and type of condition: United States, 1990	15
4. Number of acute conditions per 100 persons per year, by family income, age, and type of condition: United States, 1990	16
5. Number of acute conditions per 100 persons per year, by geographic region, place of residence, and type of condition: United States, 1990	18

Frequencies

6. Number of acute conditions, by age and type of condition: United States, 1990	19
7. Number of acute conditions, by sex, age, and type of condition: United States, 1990	20
8. Number of acute conditions, by race, age, and type of condition: United States, 1990	21
9. Number of acute conditions, by family income, age, and type of condition: United States, 1990	22
10. Number of acute conditions, by geographic region, place of residence, and type of condition: United States, 1990	24

Percent of acute conditions medically attended

11. Percent of acute conditions medically attended, by age and type of condition: United States, 1990	25
12. Percent of acute conditions medically attended, by sex, age, and type of condition: United States, 1990	26
13. Percent of acute conditions medically attended, by race, age, and type of condition: United States, 1990	27
14. Percent of acute conditions medically attended, by family income, age, and type of condition: United States, 1990	28
15. Percent of acute conditions medically attended, by geographic region, place of residence, and type of condition: United States, 1990	30

Restricted activity associated with acute conditions

Restricted-activity days: Rates

16. Number of restricted-activity days associated with acute conditions per 100 persons per year, by age and type of condition: United States, 1990	31
17. Number of restricted-activity days associated with acute conditions per 100 persons per year, by sex, age, and type of condition: United States, 1990	32
18. Number of restricted-activity days associated with acute conditions per 100 persons per year, by race, age, and type of condition: United States, 1990	33
19. Number of restricted-activity days associated with acute conditions per 100 persons per year, by family income, age, and type of condition: United States, 1990	34
20. Number of restricted-activity days associated with acute conditions per 100 persons per year, by geographic region, place of residence, and type of condition: United States, 1990	36

Restricted-activity days: Frequencies

21. Number of restricted-activity days associated with acute conditions, by age and type of condition: United States, 1990	37
22. Number of restricted-activity days associated with acute conditions, by sex, age, and type of condition: United States, 1990	38
23. Number of restricted-activity days associated with acute conditions, by race, age, and type of condition: United States, 1990	39
24. Number of restricted-activity days associated with acute conditions, by family income, age, and type of condition: United States, 1990	40
25. Number of restricted-activity days associated with acute conditions, by geographic region, place of residence, and type of condition: United States, 1990	42

Bed days: Rates

26. Number of bed days associated with acute conditions per 100 persons per year, by age and type of condition: United States, 1990	43
---	----

27. Number of bed days associated with acute conditions per 100 persons per year, by sex, age, and type of condition: United States, 1990.	44
28. Number of bed days associated with acute conditions per 100 persons per year, by race, age, and type of condition: United States, 1990.	45
29. Number of bed days associated with acute conditions per 100 persons per year, by family income, age, and type of condition: United States, 1990.	46
30. Number of bed days associated with acute conditions per 100 persons per year, by geographic region, place of residence, and type of condition: United States, 1990.	48

Bed days: Frequencies

31. Number of bed days associated with acute conditions, by age and type of condition: United States, 1990.	49
32. Number of bed days associated with acute conditions, by sex, age, and type of condition: United States, 1990.	50
33. Number of bed days associated with acute conditions, by race, age, and type of condition: United States, 1990.	51
34. Number of bed days associated with acute conditions, by family income, age, and type of condition: United States, 1990.	52
35. Number of bed days associated with acute conditions, by geographic region, place of residence, and type of condition: United States, 1990.	54

Work-loss days: Rates

36. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by age and type of condition: United States, 1990.	55
37. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by sex, age, and type of condition: United States, 1990.	56
38. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by race, age, and type of condition: United States, 1990.	57
39. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by family income, age, and type of condition: United States, 1990.	58
40. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by geographic region, place of residence, and type of condition: United States, 1990.	59

Work-loss days: Frequencies

41. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by age and type of condition: United States, 1990.	60
--	----

42. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by sex, age, and type of condition: United States, 1990.	61
43. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by race, age, and type of condition: United States, 1990.	62
44. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by family income, age, and type of condition: United States, 1990.	63
45. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by geographic region, place of residence, and type of condition: United States, 1990.	64

School-loss days: Rates

46. Number of school-loss days associated with acute conditions per 100 youths 5–17 years of age, by sex, race, family income, and type of condition: United States, 1990.	65
47. Number of school-loss days associated with acute conditions per 100 youths 5–17 years of age, by geographic region, place of residence, and type of condition: United States, 1990.	66

School-loss days: Frequencies

48. Number of school-loss days associated with acute conditions for youths 5–17 years of age, by sex, race, family income, and type of condition: United States, 1990.	67
49. Number of school-loss days associated with acute conditions for youths 5–17 years of age, by geographic region, place of residence, and type of condition: United States, 1990.	68

Incidence of acute conditions by quarter

50. Number of acute conditions per 100 persons per year and number of acute conditions, by quarter and type of condition: United States, 1990.	69
---	----

Episodes of persons injured and associated restriction of activity

51. Number of episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990.	70
52. Number of episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990.	71
53. Number of restricted-activity days associated with episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990.	72

54. Number of restricted-activity days associated with episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990	76
55. Number of bed days associated with episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990	78
56. Number of bed days associated with episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990	80

Prevalence of chronic conditions

Rates

57. Number of selected reported chronic conditions per 1,000 persons, by age: United States, 1990	82
58. Number of selected reported chronic conditions per 1,000 persons, by sex and age: United States, 1990	84
59. Number of selected reported chronic conditions per 1,000 persons, by race and age: United States, 1990	86
60. Number of selected reported chronic conditions per 1,000 persons, by family income and age: United States, 1990	88
61. Number of selected reported chronic conditions per 1,000 persons, by geographic region and place of residence: United States, 1990	92

Frequencies

62. Number of selected reported chronic conditions, by age: United States, 1990	94
63. Number of selected reported chronic conditions, by sex and age: United States, 1990	96
64. Number of selected reported chronic conditions, by race and age: United States, 1990	98
65. Number of selected reported chronic conditions, by family income and age: United States, 1990	100
66. Number of selected reported chronic conditions, by geographic region and place of residence: United States, 1990	104

Limitation of activity due to chronic conditions

67. Percent distribution of persons by degree of activity limitation due to chronic conditions according to sociodemographic characteristics: United States, 1990	106
68. Number of persons by degree of activity limitation due to chronic conditions and sociodemographic characteristics: United States, 1990	108

Restricted activity associated with acute and chronic conditions

69. Number of days per person per year and number of days of activity restriction due to acute and chronic conditions, by type of restriction and sociodemographic characteristics: United States, 1990	110
---	-----

Respondent-assessed health status

70. Number of persons and percent distribution by respondent-assessed health status, according to sociodemographic characteristics: United States, 1990	112
---	-----

Physician contacts

71. Number per person per year and number of physician contacts, by place of contact and sociodemographic characteristics: United States, 1990	114
72. Percent distribution and number of persons by interval since last physician contact, according to sociodemographic characteristics: United States, 1990	116

Hospitalization

73. Percent distribution of living persons by number of short-stay hospital episodes during the year preceding interview for all causes and excluding deliveries, according to sociodemographic characteristics: United States, 1990	118
74. Number of living persons, by number of short-stay hospital episodes during the year preceding interview for all causes and excluding deliveries and by sociodemographic characteristics: United States, 1990	120
75. Number of short-stay hospital days during the year preceding interview per living person hospitalized for all causes and excluding deliveries, by number of episodes and sociodemographic characteristics: United States, 1990	122
76. Number of short-stay hospital days during the year preceding interview for living persons hospitalized for all causes and excluding deliveries, by number of episodes and sociodemographic characteristics: United States, 1990	124
77. Number per 100 persons per year and annual number of short-stay hospital discharges, average length of stay and annual number of hospital days for living persons hospitalized for all causes and excluding deliveries, by sociodemographic characteristics: United States, 1990	126

Population

78. Number of persons of all ages and number of currently employed persons 18 years of age and over, by sociodemographic characteristics: United States, 1990	128
---	-----

Table 1. Number of acute conditions per 100 persons per year, by age and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general characteristics, and information on the survey are given in appendix I. Definitions of terms are given in appendix II]

NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSE's) can be computed by using parameter set I of table II, the frequencies of table 6, and the formula presented in table 2 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 2. Number of acute conditions per 100 persons per year, by sex, age, and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹MSA = metropolitan statistical area.

*NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSE's) can be computed by using parameter sets I and X of table II, the frequencies of tables 10 and 78, and the formula presented in rule 4 of appendix A. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 6. Number of acute conditions, by age and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design generates dual-frame and information on the 18- and 45-year age groups. The estimates are given in appendix I. Definitions of terms are given in appendix II]

NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSE's) can be computed by using parameter set I of table II and the formula presented in rule 1 of appendix X. An estimate of 75 million has a 10-percent RSE, of 1.8 million, a 20-percent RSE and of 795,000 a 30-percent RSE.

Table 7. Number of acute conditions, by sex, age, and type of condition: United States, 1990

¹Totals for income categories do not sum to total acute conditions because persons with unknown family income are not included.

NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSE's) can be computed by using parameter set I of table II and the formula presented in rule 1 of appendix A. For example, for 1.8 million, a 10-percent RSE, of 1.8 million, a 20-percent RSE, and of 795,000, a 30-percent RSE.

Table 10. Number of acute conditions, by geographic region, place of residence, and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹MSA is metropolitan statistical area

NOTES Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSE's) can be computed by using parameter set I of table II and the formula presented in rule 1 of appendix I. An estimate of 7.5 million has a 10-percent RSE, of 1.8 million, a 20-percent RSE, and of 795,000, a 30-percent RSE

Table 11. Percent of acute conditions medically attended, by age and type of condition: United States, 1990

NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors and relative standard errors (RSEs) can be computed by using parameter set I of table II, the frequencies of table 10, and the formula presented in rule 3 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 16. Number of restricted-activity days associated with acute conditions per 100 persons per year, by age and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹MSA is metropolitan statistical area.

NOTES: The standard errors and relative standard errors (RSEs) can be computed by using parameter set II of table II and the formula presented in rule 1 of appendix I. An estimate of 53.7 million has a 10-percent RSE of 13.2 million, a 20-percent RSE, and of 5.9 million, a 30-percent RSE.

Table 26. Number of bed days associated with acute conditions per 100 persons per year, by age and type of condition: United States 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹MSA = metropolitan statistical area.

NOTES: The standard errors and relative standard errors (RSEs) can be computed by using parameter set II of table II and the formula presented in rule 1 of appendix I. An estimate of 53.7 million has a 10-percent RSE of 13.2 million, a 20-percent RSE of 5.9 million, a 30-percent RSE of 3.9 million.

Table 36. Number of work-loss days associated with acute conditions per 100 currently employed persons 18 years of age and over, by age and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹ Totals for income categories do not sum to total work-loss days because persons with unknown family income are not included.

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set III of table II and the formula presented in rule 1 of appendix A. An estimate of 4 million has a 10-percent RSE, of 10.2 million, a 20-percent RSE, and of 4.6 million, a 30-percent RSE.

Table 45. Number of work-loss days associated with acute conditions for currently employed persons 18 years of age and over, by geographic region, place of residence, and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Includes other races and unknown family income.

NOTES: The standard errors and relative standard errors (RSEs) can be computed by using parameter set III of table II and the formula presented in table I of appendix A. An estimate of 41 million has a 10-percent RSE of 10.2 million, a 20-percent RSE of 4.6 million, a 30-percent RSE of 3.3 million, and a 40-percent RSE of 2.5 million.

Table 49. Number of school-loss days associated with acute conditions for youths 5–17 years of age, by geographic region, place of residence, and type of condition: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

NOTES: Excluded from these estimates are conditions involving neither medical attention nor activity restriction.

The standard errors (SE's) and relative standard errors (RSE's) for columns 1–4 can be computed by using parameter set I of table II, the frequencies of table 50, and the formula presented in rule 2 of appendix I. The SE's and RSE's for columns 5–8 can be computed by using parameter set I of table II and the formula presented in rule 1 of appendix I. An estimate of 75 million has a 10-percent RSE, of 1.8 million, a 20-percent RSE, and of 795,000, a 30-percent RSE. Rates for which the numerator has an RSE of 30 percent or more are indicated by an asterisk.

Table 51. Number of episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

Not MSA ⁴	26.1	3.2	2.7	22.6	4.0	15.0	9.2	3.6	2.3	5.4	

¹Includes unknowns for each characteristic.

²For currently employed persons 18 years of age and over only.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: Injuries coded 800–999 in the 9th revision, International Classification of Diseases, and impairments resulting from an accident are included. Injuries involving neither medical attention nor activity restriction are excluded.

The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age can be computed by using parameter set IV of table I, the frequencies of table 52, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence can be computed by using parameter sets V and VI of table I, the frequencies of tables 52 and 78, and the formula presented in rule 4 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 52. Number of episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

³Includes other races and unknown family income

⁴MSA is metropolitan statistical area

NOTES: Injuries coded 800–999 in the 9th revision, International Classification of Diseases, and impairments resulting from an accident are included. Injuries involving neither medical attention nor activity restriction are excluded.

The standard errors and relative standard errors (RSE's) can be computed by using parameter set IV of table II and the formula presented in rule 1 of appendix I. An estimate of 25 million has a 10-percent RSE, of 20-percent RSE, and of 676,000, a 30-percent RSE.

Table 53. Number of restricted-activity days associated with episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Includes unknowns for each characteristic.

²For currently employed persons 18 years of age and over only.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age can be computed by using parameter set II of table 1, the frequencies of table 54, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence can be computed by using parameter sets I and II of table II, the frequencies of tables 54 and 78, and the formula presented in rule 4 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 54. Number of restricted-activity days associated with episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

³Includes other races and unknown family income

⁴MSA is metropolitan statistical area

NOTE: The standard errors and relative standard errors (RSEs) can be computed by using parameter set II of table II and the formula presented in rule 1 of appendix I. An estimate of 53 million has a 10-percent RSE of 13.2 million, a 20-RSE of 5.9 million, a 30-percent RSE

Table 55. Number of bed days associated with episodes of persons injured per 100 persons per year, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Includes unknowns for each characteristic.

²For currently employed persons 18 years of age and over only.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age for columns 1–4 and 7–10 can be computed by using parameter sets I of table II, the frequencies of table 56, and the formula presented in rule 2 of appendix I. The SE's and RSE's for columns 5 and 6 can be computed by using parameter sets I and X of table II, the frequencies of tables 56 and 78, and the formula presented in rule 4 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence can be computed by using parameter sets II and X of table II, the frequencies of tables 56 and 78, and the formula presented in rule 4 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 56. Number of bed days associated with episodes of persons injured, by whether in moving motor vehicle, whether at work, place of accident, and sociodemographic characteristics: United States, 1990

¹Includes unknowns for each characteristic.

²For currently employed persons 18 years of age and over only.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set II of table II and the formula presented in rule 1 of appendix I. An estimate of 53 million has a 10-percent RSE of 13.2 million, a 20-percent RSE and of 5.9 million, a 30-percent RSE

Table 57. Number of selected reported chronic conditions per 1,000 persons, by age: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹See text on prevalence of reported chronic conditions

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set V of table II, the frequencies of tables 65 and 76, and the formula presented in table 4 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 61. Number of selected reported chronic conditions per 1,000 persons, by geographic region and place of residence: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹MSA is metropolitan statistical area.

²See text on prevalence of reported chronic conditions.

NOTES: The standard errors and relative standard errors (RSEs) can be computed by using parameter set V of table II, the frequencies of tables 66 and 78, and the formula presented in table 4 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 62. Number of selected reported chronic conditions, by age: United States, 1990.

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹See text on prevalence of reported chronic conditions

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set V of table I, and the formula presented in rule 1 of appendix I. An estimate of 144,000 has a 10-percent RSE, of 341,000, a 20-percent RSE, and of 151,000, a 30-percent RSE.

*See text on prevalence of reported chronic conditions.

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set V of table II and the formula presented in rule 1 of appendix I. An estimate of 1,400 has a 10-percent RSE, of 341,000 a 20-percent RSE, and of 151,000, a 30-percent RSE.

Table 64. Number of selected reported chronic conditions, by race and age: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Totals for income categories do not sum to total chronic conditions because persons with unknown family income are not included.

²See text on prevalence of reported chronic conditions.

NOTES: The standard errors and relative standard errors (RSEs) can be computed by using parameter set V of table II and the formula presented in rule 1 of appendix I. An estimate of 141,000 has a 10-percent RSE of 341,000, a 20-percent RSE, and of 151,000, a 30-percent RSE.

Table 66. Number of selected reported chronic conditions, by geographic region and place of residence: United States, 1990

Central city	100.0	86.0	14.0	9.5	4.5	5.0	4.4
Not central city	100.0	87.8	12.2	8.2	3.5	4.7	4.0
Not MSA ²	100.0	83.3	16.7	11.5	4.9	6.6	5.2

¹Includes other races and unknown family income.

²MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age can be computed by using parameter set X of table 68 and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence can be computed by using parameter set X of table 68 and the formula presented in rule 3 of appendix I.

Table 68. Number of persons by degree of activity limitation due to chronic conditions and sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

NOTES: The standard errors and relative standard errors (RSE's) can be computed by using parameter set X of table II and the formula presented in table I of appendix I. An estimate of 343,000 has a 10-percent RSE, of 87,000, a 20-percent RSE, and of 39,000, a 30-percent RSE.

¹Sum of school-loss days for children 5–17 years of age and work-loss days for currently employed persons 18 years of age and over. School-loss days are shown for the age group 5–17 years; work-loss days are shown for the age group 18 years and over and each older age group.

²Includes other races and unknown family income.

³MSA is metropolitan statistical area.

NOTES: The standard errors (SEs) and relative standard errors (RSEs) for age, age and sex, and race and age for columns 1 and 2 can be computed by using parameter set I of table II, the frequencies of table 69, and the formula presented in rule 2 of appendix I. The SEs and RSEs for family income and age, geographic region, and place of residence for columns 1 and 2 can be computed by using parameter sets II and X of table II, the frequencies of tables 69 and 78, and the formula presented in rule 4 of appendix I. The SEs and RSEs for column 3 (work-loss) can be computed by using parameter sets III and X of table II, the frequencies of tables 69 and 78, and the formula presented in rule 4 of appendix I. The SEs and RSEs for age, age and sex, and race and age for column 3 (school-loss) can be computed by using parameter set III of table II, the frequencies of table 69, and the formula presented in rule 2 of appendix I. The SEs and RSEs for family income and age, geographic region, and place of residence for column 3 (school-loss) can be computed by using parameter sets X and X of table II, the frequencies of tables 69 and 78, and the formula presented in rule 4 of appendix I. The SEs and RSEs for columns 4 and 5 can be computed by using parameter set II of table I, and the formula presented in rule 1 of appendix I. The SEs and RSEs for column 6 can be computed by using parameter set III of table II and the formula presented in rule 1 of appendix I. For restrictability and disability an estimate of 25 million has an RSE of 10 percent; 13.2 million, of 20 percent; and 5.9 million, of 30 percent. For work- or school-loss days, an estimate of 41 million has an RSE of 10 percent; 10.2 million, of 20 percent; and 4.6 million, of 30 percent. Rates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 70. Number of persons and percent distribution by respondent-assessed health status, according to sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Includes unknown health status.

²Excludes unknown health status.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for family income and age, geographic region, and place of residence for column 1 can be computed by using parameter set X of table II and the formula presented in rule 1 of appendix I. The SE's and RSE's for age, sex and age, and race and age for columns 3–7 can be computed by using parameter set X of table II, the frequencies of table 70, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence for columns 3–7 can be computed by using parameter set X of table II, the frequencies of table 70, and the formula presented in rule 3 of appendix I. An estimate of 349,000 has a 10-percent RSE, of 57,000 a 20-percent RSE, and of 39,000 a 30-percent RSE. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

¹Includes unknown place of contact.

²Does not include physician contacts while an overnight patient in a hospital.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age for columns 1–5 can be computed by using parameter set V of table II, the frequencies of table 71, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence for columns 1–5 can be computed by using parameter sets VI and X of table II, the frequencies of tables 71 and 78, and the formula presented in rule 4 of appendix I. The SE's and RSE's for columns 6–10 can be computed by using parameter set VI of table II and the formula presented in rule 1 of appendix I. An estimate of 15.1 million has a 10-percent RSE, of 3.9 million, a 20-percent RSE, and of 1.7 million, a 30-percent RSE. Rates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 72. Percent distribution and number of persons by interval since last physician contact, according to sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹Excludes unknown interval.

²Includes unknown interval.

³Includes physician contacts while an overnight patient in a hospital.

⁴Includes other races and unknown family income.

⁵MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age for columns 2–5 can be computed by using parameter set X of table I, the frequencies of table 72, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence for columns 2–5 can be computed by using parameter set X of table II, the frequencies of table 72, and the formula presented in rule 3 of appendix I. The SE's and RSE's for columns 6–10 can be computed by using parameter set Y of table II and the formula presented in rule 1 of appendix I. An estimate of 349,000 has a 10-percent RSE; of 87,000, a 20-percent RSE, and of 39,000 a 30-percent RSE.

Table 73. Percent distribution of living persons by number of short-stay hospital episodes during the year preceding interview for all causes and excluding deliveries, according to sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II.]

¹Based on reason for admission or other indication of delivery.

²Includes other races and unknown family income.

³MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex and age, and race and age can be computed by using parameter set X of table 1, the frequencies of table 74 and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence can be computed by using parameter set Y of table 1, the frequencies of table 78, and the formula presented in rule 3 of appendix I. Estimates for which the numerator has an RSE of more than 30 percent are indicated with an asterisk.

Table 74. Number of living persons, by number of short-stay hospital episodes during the year preceding interview for all causes and excluding deliveries and by sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

¹Includes unknown cause, based on 6-month reference period.

²Based on reason for admission or other indication of delivery.

³Includes other races and unknown family income.

⁴MSA is metropolitan statistical area.

NOTES: The standard errors (SE's) and relative standard errors (RSE's) for age, sex, and age and race and age for columns 1 and 5 can be computed by using parameter set I of table II, the frequencies of table 77, and the formula presented in rule 2 of appendix I. The SE's and RSE's for family income and age, geographic region, and place of residence for columns 1 and 5 can be computed by using parameter sets VIII and X of table II, the frequencies of tables 77 and 78, and the formula presented in rule 4 of appendix I. The SE's and RSE's for columns 2 and 6 can be computed by using parameter set VIII of table II and the formula presented in rule 1 of appendix I. The SE's and RSE's for columns 4 and 8 can be computed by using parameter set I of table II and the formula presented in rule 1 of appendix I. The SE's and RSE's for columns 3 and 7 can be computed by using parameter sets VIII and X of table II, the frequencies of tables 77 and 78, and the formula presented in rule 4 of appendix I. An estimate of 657,000 discharges has a 10-percent RSE, of 163,000, a 20-percent RSE, and of 72,000, a 30-percent RSE. An estimate of 12.7 million hospital days has a 10-percent RSE, of 2.6 million, a 20-percent RSE, and of 1.1 million, a 30-percent RSE.

Table 78. Number of persons of all ages and number of currently employed persons 18 years of age and over, by sociodemographic characteristics: United States, 1990

[Data are based on household interviews of the civilian noninstitutionalized population. The survey design, general qualifications, and information on the reliability of the estimates are given in appendix I. Definitions of terms are given in appendix II]

NOTES: The standard errors and relative standard errors (RSE's) for currently employed persons, family income and age, geographic region and age, and place of residence and age can be computed by using parameter set X of table II and the formula presented in rule 1 of appendix I. An estimate of 349,000 has a 10-percent RSE, of 87,000 a 20-percent RSE, and of 39,000 a 30-percent RSE.

Technical notes on methods

Background

This report is one of a series of statistical reports published by the staff of the National Center for Health Statistics (NCHS). It is based on information collected in a continuing nationwide sample of households included in the National Health Interview Survey (NHIS). Data are obtained on the personal, sociodemographic, and health characteristics of the family members and unrelated individuals living in these households.

Field operations for the survey are conducted by the U.S. Bureau of the Census under specifications established by NCHS. The U.S. Bureau of the Census participates in the survey planning, selects the sample, and conducts the interviews. The data are then transmitted to NCHS for preparation, processing, and analysis.

Summary reports and reports on special topics for each year's data are prepared by the staff of the Division of Health Interview Statistics for publication in Series 10 publications of NCHS. Data are also tabulated for other reports published by NCHS staff and for use by other organizations and by researchers within and outside the Government. Since 1969, public use tapes have been prepared for each year of data collection.

It should be noted that the health characteristics described by NHIS estimates pertain only to the resident, civilian noninstitutionalized population of the United States living at the time of the interview. The sample does not include persons residing in nursing homes, members of the armed forces, institutionalized persons, or U.S. nationals living abroad.

Statistical design of NHIS

General design

Data from NHIS have been collected continuously since 1957. The sample design of the survey has undergone changes following each decennial census. This periodic redesign of the NHIS sample allows the incorporation of the latest population information and statistical methodology into the survey design. The data presented in this report are from an NHIS sample design first used in 1985. It is anticipated that this design will be used until 1995.

The sample design plan of the NHIS follows a multi-stage probability design that permits a continuous

sampling of the civilian noninstitutionalized population residing in the United States. The survey is designed in such a way that the sample scheduled for each week is representative of the target population, and the weekly samples are additive over time. This design permits estimates for high-frequency measures or for large population groups to be produced from a short period of data collection. Estimates for low-frequency measures or for smaller population subgroups can be obtained from a longer period of data collection. The annual sample is designed so that tabulations can be provided for each of the four major geographic regions. Because interviewing is done throughout the year, there is no seasonal bias for annual estimates.

The continuous data collection also has administrative and operational advantages because fieldwork can be handled on a continuing basis with an experienced, stable staff.

Sample selection

The target population for NHIS is the civilian noninstitutionalized population residing in the United States. For the first stage of the sample design, the United States is considered to be a universe composed of approximately 1,900 geographically defined primary sampling units (PSU's). A PSU consists of a county, small group of contiguous counties, or a metropolitan statistical area. The PSU's collectively cover the 50 States and the District of Columbia. The 52 largest PSU's are selected into the sample with certainty and are referred to as self-representing PSU's. The other PSU's in the universe are referred to as non-self-representing PSU's. These PSU's are clustered into 73 strata, and 2 sample PSU's are chosen from each stratum with probability proportional to population size. This gives a total of 198 PSU's selected in the first stage.

Within a PSU, two types of second stage units are used: area segments and permit area segments. Area segments are defined geographically and contain an expected eight households. Permit area segments cover geographical areas containing housing units built after the 1980 census. The permit area segments are defined using updated lists of building permits issued in the PSU since 1980 and contain an expected four households.

Within each segment all occupied households are targeted for interview. On occasion, a sample segment

may contain a large number of households. In this situation the households are subsampled to provide a manageable interviewer workload.

The sample was designed so that a typical NHIS sample for the data collection years 1985 to 1995 will consist of approximately 7,500 segments containing about 59,000 assigned households. Of these households, an expected 10,000 will be vacant, demolished, or occupied by persons not in the target population of the survey. The expected sample of 49,000 occupied households will yield a probability sample of about 127,000 persons.

Features of the NHIS sample redesign

Starting in 1985, the NHIS design incorporated several new design features (8). The major changes include the following:

1. *The use of an all-area frame.* The NHIS sample is now designed so that it can serve as a sample frame for other NCHS population-based surveys. In previous NHIS designs about two-thirds of the sample was obtained from lists of addresses compiled at the time of the decennial census; that is, a list frame. Due to U.S. Bureau of the Census confidentiality restrictions, these sample addresses could be used for only those surveys being conducted by the U.S. Bureau of the Census. The methodology used to obtain addresses in the 1985 NHIS area frame does not use the census address lists. The sample addresses thus obtained can be used as a sampling frame for other NCHS surveys.
2. *The NHIS as four panels.* Four national subdesigns, or panels, constitute the full NHIS. Each panel contains a representative sample of the U.S. civilian noninstitutionalized population. Each of the four panels has the same sampling properties, and any combination of panels defines a national design. Panels were constructed to facilitate the linkage of NHIS to other surveys, and also to efficiently make large reductions in the size of the sample by eliminating panels from the survey.

In 1990 the sample consisted of 8,112 segments containing 60,481 assigned households. Of the 48,680 households eligible for interview, 46,476 households were actually interviewed, resulting in a sample of 119,631 persons.

3. *The oversampling of black persons.* One of the goals in designing the current NHIS was to improve the precision of estimates for black persons. This was accomplished by the use of differential sampling rates in PSU's with between about 5- and 50-percent black population. Sampling rates for selection of segments were increased in areas known to have the highest concentrations of black persons. Segment sampling rates were decreased in other areas within the PSU to ensure that the total sample in each PSU was the same size as it would have been without oversampling black persons.

4. *The reduction of the number of sampled PSU's.* Interviewer travel to sample PSU's constitutes a large component of the total field costs for the NHIS. The previous NHIS design included 376 PSU's. Research showed that reducing the number of sample PSU's while increasing the sample size within PSU's would reduce travel costs and also maintain the reliability of health estimates. The design now contains 198 PSU's.
5. *The selection of two PSU's per non-self-representing stratum.* In the previous design, one PSU was selected from each non-self-representing stratum. This feature necessitated the use of less efficient variance estimation procedures; the selection of two PSU's allows more efficient variance estimation methodology.

Collection and processing of data

The NHIS questionnaire contains two major parts: The first consists of topics that remain relatively the same from year to year. Among these topics are the incidence of acute conditions, the prevalence of chronic conditions, persons limited in activity due to chronic conditions, restriction in activity due to impairment or health problems, and utilization of health care services involving physician care and short-stay hospitalization. Occasionally new questions are incorporated into the main questionnaire. Since 1985, questions that ask the household members' city and state of birth, social security number, and father's last name, have been included. In 1989, questions were added that ask the location (city, county, and state) of any physician contact whether by telephone or in person; and for household members born in the United States, how many years they have lived in the state of residence, and for household members born in a foreign country, how many years they have lived in the United States. The second part consists of special topics added as supplements to each year's questionnaire. Beginning in August 1987, a special set of supplemental questions on the adult population's knowledge and attitudes about acquired immunodeficiency syndrome (AIDS) was added to the National Health Interview Survey using Computer Assisted Personal Interview (CAPI). A copy of the most recent questionnaire, not included in Current Estimates prior to 1989, is shown in appendix III.

Careful procedures are followed to assure the quality of data collected in the interview. Most households in the sample are contacted by mail before the interviewers arrive. Potential respondents are informed of the importance of the survey and assured that all information obtained in the interview will be held in strict confidence. Interviewers make repeated trips to a household when a respondent is not immediately found. The success of these procedures is indicated by the response rate for the survey, which has been between 95 and 98 percent over the years.

When contact is made, the interviewer attempts to have all family members of the household 19 years of age

and over present during the interview. When this is not possible, proxy responses for absent adult family members are accepted. In most situations, proxy respondents are used for persons under 19 years of age. Persons 17 and 18 years of age may respond for themselves, however.

Interviewers undergo extensive training and retraining. The quality of their work is checked by means of periodic observation and by reinterview. Their work is also evaluated by statistical studies of the data they obtain in their interviews. A field edit is performed on all completed interviews so that if there are any problems with the information on the questionnaire, respondents may be recontacted to solve the problem.

Completed questionnaires are sent from the U.S. Bureau of the Census field offices to NCHS for coding and editing. To ensure the accuracy of coding, a 5-percent sample of all questionnaires is recoded and keyed by other coders. A 100-percent verification procedure is used if certain error tolerances are exceeded. Staff of the Division of Health Interview Statistics then edit the files to remove impossible and inconsistent codes.

The interview, fieldwork, and data processing procedures summarized above are described in detail in Series 1, No. 18 (9).

Estimation procedures

Because the design of NHIS is a complex multistage probability sample, it is necessary to reflect these complex procedures in the derivation of estimates (8). The estimates presented in this report are based upon 1990 sample person counts weighted to produce national estimates. The weight for each sample person is the product of four component weights:

1. *Probability of selection.* The basic weight for each person is obtained by multiplying the reciprocals of the probabilities of selection at each step in the design: PSU, segment, and household.
2. *Household nonresponse adjustment within segment.* In NHIS, interviews are completed in about 95 percent of all eligible households. Because of household nonresponse, a weighting adjustment is required. The nonresponse adjustment weight is a ratio with the number of households in a sample segment as the numerator and the number of households actually interviewed in that segment as the denominator. This adjustment reduces bias in an estimate to the extent that persons in the noninterviewed households have the same characteristics as the persons in the interviewed households in the same segment.
3. *First-stage ratio adjustment.* The weight for persons in the non-self-representing PSUs is ratio adjusted to the 1980 population within four race-residence classes of the non-self-representing strata within each geographic region.
4. *Poststratification by age-sex-race.* Within each of 60 age-sex-race cells (table 1), a weight is constructed

Table 1. The 60 poststratification age-sex-race cells in the National Health Interview Survey

Age	Male		Female	
	Male	Female	Male	Female
0-4 years	/	/	/	/
5-9 years	/	/	/	/
10-14 years	/	/	/	/

55-64 years	/	/	/	/
65-74 years	/	/	/	/
75 years and over	/	/	/	/

each quarter to ratio adjust the first-stage population estimate based on the NHIS to an independent estimate of the population of each cell. These independent estimates are prepared by the U.S. Bureau of the Census and are updated quarterly.

The main effect of the ratio-estimating process is to make the sample more closely representative of the target population by age, sex, race, and residence. The poststratification adjustment helps to reduce the component of bias resulting from sampling frame undercoverage; furthermore, this adjustment frequently reduces sampling variance.

Types of estimates

As noted, NHIS data were collected on a weekly basis, with each week's sample representing the resident, civilian noninstitutionalized population of the United States living during that week. The weekly samples are consolidated to produce quarterly files (each consisting of data for 13 weeks). Weights to adjust the data to represent the U.S. population are assigned to each of the four quarterly files. These quarterly files are later consolidated to produce the annual file, which is the basis of most tabulations of NHIS data.

NHIS uses various reference periods to reduce the amount of bias associated with respondent memory loss. A 2-week reference period is used in collecting data on the incidence of acute conditions, restriction in activity due to a health problem, and physician contacts. Each of these measures health events that may be forgotten soon after they occur. Examples of such events are telephoning a physician about a minor illness, missing a day from work because of a routine health problem, or having a cold. Either a 12- or 6-month (depending on the type of statistic) reference period is used for hospitalization data because hospitalization ordinarily involves a major event in a person's life and is not quickly forgotten. Chronic condition prevalence estimates are based on a 12-month reference period.

Because most NHIS estimates based on a 2-week reference period are designed to represent the number of health events for a 12-month period, these data must be adjusted to an annual basis. Data based on a 2-week reference period are multiplied by 6.5 to produce the 13-week estimate for the quarter. These reference period adjustments are made at the time that the quarterly files are produced. Therefore, the data can be used to produce estimates for each quarter and are used that way to study seasonal variation. The data from the four quarterly files (representing the number of events in each quarter) are summed to produce the annual estimate. Although these data are collected for only 2 weeks for each person included in the survey, any unusual event that may have occurred during a particular 2-week period does not bias the estimate because the quarterly estimate is a sum of the estimates produced for each week's sample during the entire quarter and the annual estimate is the sum of the four quarters.

For prevalence statistics, such as the number of persons limited in activity due to chronic conditions, the annual estimate results from summing the weighted quarterly files and dividing by 4. This division is necessary because, as noted above, each quarterly file has been weighted to produce an estimate of the number of persons in the U.S. population with a given characteristic. Summing the four quarters and dividing by 4 in effect averages these quarterly results for the year. Thus, the type of prevalence estimate ordinarily derived from NHIS data is an annual average prevalence estimate.

For data related to short-stay hospital discharges that are based on a 6-month reference period, cases identified during any quarter of data collection are multiplied by 2 to produce a quarterly estimate of the annual number of characteristics associated with short-stay hospital discharges. The NHIS average annual estimate of hospital discharges is derived by summing the four quarterly estimates and dividing by 4, just as the prevalence estimates are.

Reliability of the estimates

Because NHIS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same survey and processing procedures. There are two types of errors possible in an estimate based on a sample survey: Sampling and non-sampling errors. To the extent possible, these types of errors are kept to a minimum by methods built into the survey procedures described earlier (10). Although it is very difficult to measure the extent of bias in NHIS, several studies have been conducted to examine this problem. The results have been published in several reports (11-14).

Nonsampling errors

Interviewing process—Information, such as the number of days of restricted activity caused by the condition, can

be obtained more accurately from household members than from any other source because only the persons concerned are in a position to report this information. However, there are limitations to the accuracy of diagnostic and other information collected in household interviews. For example, for diagnostic information, the household respondent can usually pass on to the interviewer only the information the physician has given to the family. For conditions not medically attended, diagnostic information is often no more than a description of symptoms. Further, a respondent may not answer a question in the intended manner because he or she has not properly understood the question, has forgotten the event, does not know, or does not wish to divulge the answer. Regardless of the type of measure, all NHIS data are estimates of known reported morbidity, disability, and so forth.

Reference period bias—NHIS estimates do not represent a complete measure of any given topic during the specified calendar period because data are not collected in the interview for persons who died or became institutionalized during the reference period. For many types of statistics collected in the survey, the reference period is the 2 weeks prior to the interview week. For such a short period, the contribution by decedents to a total inventory of conditions or services should be very small. However, the contribution by decedents during a long reference period (such as 1 year) might be significant, especially for older persons.

Underreporting associated with a long reference period is most germane to data on hospitalization. Analysis has shown that there is an increase in underreporting of hospitalizations with an increase in the time interval between the discharge and the interview. Exclusive of the hospital experience of decedents, the net underreporting using a 12-month recall period is in the neighborhood of 10 percent (15). The underreporting of discharges within 6 months of the week of interview is estimated to be about 5 percent (15). For this reason, hospital discharge data are based on hospital discharges reported to have occurred within 6 months of the week of interview.

Because hospitalization is common in the period immediately preceding death or institutionalization and older persons are much more likely to die than younger ones, the data should not be used to estimate the volume of hospitalization of the elderly although the data can be used to measure characteristics of elderly people.

It should further be noted that, although the reported frequencies and rates related to hospital episodes are presented by the year in which the data were collected, the estimates are, in most cases, based on hospitalizations that occurred during the year of data collection and the prior year. Overall, approximately one-half of the reported hospitalizations for the 12-month reference period occurred in the year prior to the year of data collection.

Population estimates—Some of the published tables include population figures for specified categories. Except for overall totals for the 60 age, sex, and race groups, which are adjusted to independent estimates, these figures

are based on the sample of households in NHIS. They are given primarily to provide denominators for rate computation, and for this purpose they are more appropriate for use with the accompanying measures of health characteristics than other population data that may be available. With the exception of the overall totals by age, sex, and race mentioned above, the population figures may differ from figures (which are derived from different sources) published in reports of the U.S. Bureau of the Census. Official population estimates are presented in U.S. Bureau of the Census reports in Series P-20, P-25, and P-60.

Rounding of numbers—In published tables, the figures are rounded to the nearest thousand, although they are not necessarily accurate to that detail. Derived statistics, such as rates and percent distributions, are computed after the estimates on which these are based have been rounded to the nearest thousand.

Combining data years—To reduce sampling error, data for number of years may be combined. However, in so doing, the questionnaire for each of the years should be checked, because even a small change in the questionnaire design may lead to large changes in the derived estimates. This caution also applies to using NHIS data on health measures where changes in other events, such as legislative changes, have occurred over time.

Sampling errors

The standard error is primarily a measure of sampling error, that is, the variations that might occur by chance because only a sample of the population is surveyed. The chances are about 68 in 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 in 100 that the difference would be less than twice the standard error and about 99 in 100 that it would be less than 2½ times as large.

Individual standard errors were not computed for each estimate in this report. Instead, standard errors were computed for a broad spectrum of estimates. Regression techniques were then applied to produce equations from which a standard error for any estimate can be

approximated. The regression equations and the parameters a and b , are presented in table II. Also, a and b are the cutoff values, the estimates below which the relative standard error is greater than 30 percent, and estimates below most NHIS standards of statistical reliability. Rule 1 explaining their use are presented in the section below.

The reader is cautioned that the procedure will give an approximate standard error of an estimate rather than the precise standard error. The reader is further cautioned that particular care should be exercised when the denominator is small.

General rules for determining standard errors

To produce approximate standard errors for NHIS estimates, the reader must first determine the type of characteristic to be estimated, that is, the parameter set in table II to be used. The reader must then determine the type of estimate for which the standard error is needed. The type of estimate corresponds to one of five general rules for determining standard errors.

Rule 1. Estimated number of people or events—For the estimated number of people or events published in this report, there are two cases to consider. For the first case, if the estimated number is any combination of the poststratification age-sex-race cells in table I, then its value has been adjusted to official U.S. Bureau of the Census figures and its standard error is assumed to be 0.0. This corresponds to parameter set XI in table II. As an example, this would be the case for the number of persons in the U.S. target population or the number of black persons in the 18–44 year age group. Although the race class “white” is not specifically adjusted to U.S. Bureau of the Census figures, it dominates the poststratification “all other” race class; consequently, age-sex-“all other” race combinations of table I can be treated as age-sex-white combinations for the purpose of approximating standard errors.

Table II. Estimated standard error parameters and 30-percent relative standard error (RSE) cutoff points for the National Health Interview Survey, 1990

Parameter set	Characteristic	Estimated parameters		30 percent RSE cutoff points ¹
		a	b	
I	Number of acute conditions	0.000388	71.800	188.000
II	Days of restricted activity or bed days	0.000291	521.000	8,800.000
III	Days lost from work or school	0.000127	408.000	4,800.000
IV	Number of episodes of persons injured	0.000650	80.000	800.000
V	Prevalence of chronic conditions	0.0000668	16.800	16.000
VI	Number of physician contacts based on a 2-week reference period	0.0001638	16.000	16.000
VII	Hospital days based on a 12-month reference period	0.000789	61.800	61.000
VIII	Hospital discharges based on a 6-month reference period	0.000119	61.480	11.000
IX	Hospital discharge days based on a 6-month reference period	0.00010	98.800	11.000
X	Population estimates for demographic, socioeconomic, and health characteristics	0.0001143	0.480	80.000
XI	Age-sex-race population based on combining the poststratification cells of table I	0.0	0.0	80.000

¹Estimates below the cutoff points have an RSE of more than 30 percent and are considered to be statistically unreliable.

*NOTE: The 1990 NHIS was based on a full sample. Therefore, 46,476 households were interviewed, resulting in a sample of 118,621 persons.

For the second case, the standard errors for all other estimates of numbers of people or events, such as the number of people limited in activity or the number of acute conditions, are approximated by using the parameters provided in table II and formula 1 below.

If the aggregate x for a characteristic has associated parameters a and b , then the approximate standard error for x , $SE(x)$, can be computed by the formula

$$SE(x) = \sqrt{ax^2 + bx} \quad (1)$$

Example of rule 1. As shown in table 7, the estimated number of acute conditions for males is 183,081,000. From table II, parameter set I, the a and b parameters for the numbers of acute conditions are 0.000368 and 71,300, respectively. Using formula 1, the estimated standard error is

$$\begin{aligned} &\sqrt{(0.000368)(183,081,000)^2 + (71,300)(183,081,000)} \\ &= 5,038.704 \end{aligned}$$

An approximate 95-percent confidence interval for the number of acute conditions for males is from 173,205,140 to 192,956,860 ($183,081,000 \pm 1.96(5,038.704)$).

Rule 2. *For rates, proportions, and percents when the denominator is generated by the poststratification age-sex-race classes (table I)*—In this case, the denominator has no sampling error. For example, rule 2 would apply to the estimated number of bed days per person for black persons age 65 years and over because the denominator is a combination of the poststratification cells. Approximate standard errors for such estimates can be computed using table II a and b parameters associated with the numerator characteristics along with formula 2 below.

If the estimate of rate, proportion, or percent p is the ratio of two estimated numbers, $p = x/Y$ (where p may be inflated by 100 for percents or 1,000 for rates per 1,000 persons), with Y having no sampling error, then the approximate standard error for p is given by the formula

$$SE(p) = p \sqrt{a + \frac{b}{x}} \quad (2)$$

In this report, the value of the denominator Y is always provided, but in a few cases the numerator value x is not published. For these cases the value of x may be computed by the formula

$$x = \begin{cases} pY & \text{if } p \text{ is a proportion or rate per unit or} \\ \frac{pY}{100} & \text{if } p \text{ is a percent or rate per 100 units or} \\ \frac{pY}{1,000} & \text{if } p \text{ is a rate per 1,000 units} \end{cases}$$

Example of rule 2. From table 18, the rate of restricted-activity days associated with acute conditions for black persons in the 18–44 year age group is estimated to be 701.8 days per 100 persons per year. Here, $p = 701.8$ and can be expressed as $(100)x/Y$. From table 23, $x = 90,934,000$ restricted-activity days, and from table 78, $Y = 12,957,000$ persons. From table II, parameter set II, the parameters a and b for restricted-activity days are 0.000291 and 521,000, respectively. Using formula 2, the estimated standard error for the rate is

$$701.8 \sqrt{0.000291 + \frac{521,000}{90,934,000}} = 54.5 \text{ days}$$

An approximate 95-percent confidence interval for the number of restricted-activity days associated with acute conditions per 100 persons per year for black persons aged 18–44 years is from 595.0 to 808.6 days. If the value of x had not been published, it could have been obtained by the computation

$$x = 701.8 \frac{12,957,000}{100} = 90,932,226$$

The small difference between this computed value of x and the actual estimate can be attributed to rounding and would not significantly affect the computation of the standard error.

Rule 3. *Proportions and percents when the denominator is not generated by the poststratification age-sex-race classes*—If p represents an estimated percent, b is the parameter from table II associated with the numerator characteristics, and y is the number of persons in the denominator upon which p is based, then the standard error of p may be approximated by

$$SE(p) = \sqrt{\frac{bp(100 - p)}{y}} \quad (3)$$

(If p is a proportion, then the above formula can be used but with 100 replaced by 1.0.)

Example of rule 3. In table 70, it is estimated that 41.1 percent of persons in the Northeast have excellent health status. This percent is based upon the denominator estimate of 49,901,000 persons living in the Northeast. From table II, parameter set X, parameter b associated with health status is 3,490. Using formula 3, the standard error for the percent is

$$\sqrt{\frac{3,490(41.1)(100.0 - 41.1)}{49,901,000}} = 0.4 \text{ percent}$$

An approximate 95-percent confidence interval for the percent of persons in the Northeast having excellent health status as perceived by the respondent is from 40.3 to 41.9 percent.

Rule 4. Rates when the denominator is not generated by the poststratification age-sex-race classes—If the estimated rate p is expressed as the ratio of two estimates, $p = x/y$ (inflated by 100 or 1,000 when appropriate), then the estimated standard error for p is given by the formula

$$SE(p) = p \sqrt{\frac{SE(x)^2}{x^2} + \frac{SE(y)^2}{y^2} - 2r \frac{SE(x)}{x} \frac{SE(y)}{y}} \quad (4)$$

where $SE(x)$ and $SE(y)$ are computed using rule 1 and x and y are obtained from the tables. No estimates of r , the correlation between the numerator and denominator, are presented in this report; therefore, only the first two terms are available. The reader must assume that $r = 0.0$. Assuming $r = 0.0$ will yield an overestimate of the standard error if r is actually positive and an underestimate if r is negative.

Example of rule 4. Table 75 shows an estimate of 9.3 hospital days per male person hospitalized. From tables 76 and 74 it can be seen that this estimated rate is the ratio of 69,762,000 hospital days for males to 7,494,000 males having one or more hospital episodes. From table II, parameter set VII, the numerator a and b parameters are 0.000789 and 54,600, respectively. From parameter set X, the denominator a and b values are -0.0000143 and 3,490, respectively. Using rule 1, the standard error for the numerator is approximately 2,765.657 days and the standard error for the denominator is approximately 159,220 persons.

Using formula 4 with $r = 0.0$, the standard error of the rate is estimated by

$$9.3 \sqrt{\frac{2,765.657^2}{69,762,000^2} + \frac{159,220^2}{7,494,000^2}}$$

= 0.4 days per person

An approximate 95-percent confidence interval for the number of hospital days per hospitalized male is from 8.5 to 10.1 days.

Rule 5. Difference between two statistics (mean, rate, total, and proportion)—If x and x_1 are two estimates,

then the standard error of the difference is computed by rule 4.

$$SE(x - x_1)$$

$$= \sqrt{SE(x)^2 + SE(x_1)^2 - 2r SE(x) SE(x_1)} \quad (5)$$

where $SE(x)$ and $SE(x_1)$ are computed by rule 1 or 4 as appropriate and r is the correlation coefficient between x and x_1 .

Assuming $r = 0.0$ will result in an accurate standard error if the two estimates are actually uncorrelated and will result in an overestimate of the standard error if the correlation is positive or an underestimate if the correlation is negative.

Example of rule 5. Table 70 shows estimates of 41.1 percent of persons in the Northeast and 40.3 percent of persons in the Midwest having excellent health status. In the example of rule 3, it was shown that the standard error of the Northeast percent is approximately 0.4 percent. The standard error for the Midwest percent, computed similarly, is also 0.4 percent. From formula 5, with $r = 0.0$, the standard error estimated for the difference $(41.1 - 40.3) = 0.8$ is

$$\sqrt{(0.4)^2 + (0.4)^2} = 0.6 \text{ percent}$$

An approximate 95-percent confidence interval for this difference is from -0.4 to 2.0 percent. Thus the difference in percent of persons in excellent health between the Northeast and the Midwest is not significant at the 0.05 level.

Relative standard errors

Prior to 1985, relative standard error (RSE) curves were present in *Current estimates* for approximating relative standard errors. For readers who wish to continue using them, the following provides guidance. The RSE of an estimate is obtained by dividing the standard error (SE) of the estimate by the estimate x itself. This quantity is expressed as a percent of the estimate:

$$RSE = 100 \frac{SE(x)}{x}$$

Example of a relative standard error. In the example from rule 2, it was shown that the estimated rate of 701.8 restricted-activity days associated with acute conditions per 100 persons per year for black persons aged 18-24 years had an estimated standard error of 54.5 days. The relative standard error for the rate is

$$100 \frac{54.5}{701.8} = 7.8 \text{ percent}$$

Appendix II

Definitions of certain terms used in this report

Terms relating to conditions

Condition—Condition is a general term that includes any specific illness, injury, or impairment. Condition data are derived from the survey in two ways. First, respondents are asked to identify any conditions that caused certain types of impact associated with health, such as a visit to a doctor or a day spent in bed. Second, respondents are read lists of selected chronic conditions and asked whether they or any family members have any of these conditions.

At a later point in the survey, a series of questions is asked about each of the conditions identified in either of the two ways just described. The information obtained on each condition helps to clarify the nature of the condition and whether medical services have been involved in its diagnosis or treatment. It also aids in the coding of the condition. All conditions except impairments are coded according to the ninth revision of the *International Classification of Diseases* (2), with certain modifications adopted to make the codes more suitable for information derived from a household survey. A special set of codes devised by NHIS is used to code impairments.

Chronic condition—A condition is considered chronic if (a) the respondent indicates it was first noticed more than 3 months before the reference date of the interview, or (b) it is a type of condition that ordinarily has a duration of more than 3 months. Examples of conditions that are considered chronic regardless of their time of onset are diabetes, heart conditions, emphysema, and arthritis. A complete list of these conditions may be obtained by contacting the Division of Health Interview Statistics, National Center for Health Statistics.

Impairment—An impairment is a chronic or permanent defect, usually static in nature, that results from disease, injury, or congenital malformation. It represents a decrease in or loss of ability to perform various functions, particularly those of the musculoskeletal system and the sense organs. Impairments are grouped, according to type of functional impairment and etiology in the special NHIS impairment codes.

Acute condition—A condition is considered acute if (a) it was first noticed no longer than 3 months before the reference date of the interview and (b) it is not one of the conditions considered chronic regardless of the time of onset. (See definition of chronic condition.) However, any

acute condition not associated with either at least one doctor visit or at least one day of restricted activity during the reference period is considered to be of minor consequence and is excluded from the final data produced by the survey.

Onset of condition—A condition is considered to have had its onset when it was first noticed. This could be the time the person first felt sick or became injured, or it could be the time the person or family was first told by a physician that the person had a condition of which he or she had been previously unaware.

Incidence of conditions—The incidence of a condition is the number of cases that had their onset during a specified period of time. A person may have more than one acute condition during a period of time or may have the same condition, such as a headache, more than once. Ordinarily, however, a chronic condition can begin only one time during a given reference period.

Prevalence of conditions—The prevalence of a condition is the number of persons who have the condition at a given point in time. Although the prevalence of acute conditions is a meaningful concept, it is seldom used in health statistics, which generally focus on the incidence of acute conditions. If the prevalence of a chronic condition is measured during a period of time (say, each week during a year), then the resulting estimate of prevalence is an average of 52 weekly prevalence estimates. This is called an average annual point prevalence estimate.

Terms relating to disability

Disability—Disability is a general term that refers to any long- or short-term reduction of a person's activity as a result of an acute or chronic condition. *Limitation of activity* refers to a long-term reduction in a person's capacity to perform the average kind or amount of activities associated with his or her age group. *Restriction of activity* refers to particular kinds of behavior usually associated with a reduction in activity due to either long- or short-term conditions. Thus limitation of activity refers to what a person is generally capable of doing, but restriction of activity ordinarily refers to a relatively short-term reduction in a person's activities below his or her normal capacity.

Limitation of activity because of chronic conditions—Persons are classified in terms of the major activity

usually associated with their particular age group. The major activities for the age groups are (a) ordinary play for children under 5 years of age, (b) attending school for those 5–17 years of age, (c) working or keeping house for persons 18–69 years of age, and (d) capacity for independent living (e.g., the ability to bathe, shop, dress, eat, and so forth, without needing the help of another person) for those 70 years of age and over. People aged 18–69 years who are classified as keeping house are also classified by their ability to work at a job or business. (In this report, the major activity of persons 65–69 years is assumed to be working or keeping house; however, questions were also asked about the capacity for independent living in this age group, which would permit an alternative definition of limitation.)

In regard to these activities, each person is classified into one of four categories: (a) unable to perform the major activity, (b) able to perform the major activity but limited in the kind or amount of this activity, (c) not limited in the major activity but limited in the kind or amount of other activities, and (d) not limited in any way. In regard to these four categories, NHIS publications often classify persons only by whether they are limited (groups a–c) or not limited (group d). Persons are not classified as limited in activity unless one or more chronic conditions are reported as the cause of the activity limitation. If more than one condition is reported, the respondent is asked to identify the condition that is the major cause of the limitation.

Restriction of activity—Four types of restricted activity are measured in NHIS: *bed days*, *work-loss days* for currently employed persons 18 years of age and over, *school-loss days* for children 5–17 years of age, and *cut-down days*.

A *bed day* is one during which a person stayed in bed more than half a day because of illness or injury. All hospital days for inpatients are considered bed days even if the patient was not in bed more than half a day.

A *work-loss day* is one on which a currently employed person 18 years of age and over missed more than half a day from a job or business.

A *school-loss day* is one on which a student 5–17 years of age missed more than half a day from the school in which he or she was currently enrolled.

A *cut-down day* is a day on which a person cuts down for more than half a day on the things he or she usually does.

Work-loss, school-loss, and cut-down days refer to the short-term effects of illness or injury. However, bed days are a measure of both long- and short-term disability, because a chronically ill bedridden person and a person with a cold could both report having spent more than half a day in bed due to an illness.

The number of restricted-activity days is the number of days a person experienced at least one of the four types of activity restriction just described. It is the most inclusive measure of disability days and the least descriptive; 4 days of restricted activity may mean 4 bed days associated with

serious illness or 4 day—during which a person merely cut down on his or her activities due to a mild illness.

A single restricted-activity day may involve both a bed day and a work-loss or school-loss day. However, a cut-down day cannot overlap with any of these three types of disability days. In calculating the sum of restricted-activity days, each day is counted only once even if more than one type of activity restriction was involved.

Restricted-activity days may be associated with either persons or conditions. *Person days* are the number of days during which a person restricted his or her activity. *Condition days* are the number of days during which a condition caused a person to restrict his or her activity. A person day of restricted activity can be caused by more than one condition. In such a case, each condition causing restriction is associated with that day of restricted activity. Therefore, the number of condition days of restricted activity may exceed the number of person days of restricted activity. This relationship holds for each type of restricted-activity day.

When two or more conditions cause a day of restricted activity, the conditions may be (a) both (all) acute, (b) one (some) acute and the other (some) chronic, or (c) both (all) chronic. The number of restricted-activity days associated with acute conditions includes groups (a) and (b); the number of such days associated with chronic conditions includes groups (b) and (c). The phrase “associated with” rather than “caused by” is used to indicate that some days associated with acute or chronic conditions are not necessarily caused solely by that type of condition.

Assessed health status—The categories related to this concept result from asking the respondent, “Would you say _____’s health is excellent, very good, good, fair, or poor?” As such, it is based on a respondent’s opinion and not directly on any clinical evidence.

Terms relating to persons injured

Injury condition—An injury condition, or simply an injury, is a condition of the type that is classified according to the nature-of-injury code numbers (800–999) in the ninth revision of the *International Classification of Diseases* (2). In addition to fractures, lacerations, contusions, burns, and so forth, which are commonly thought of as injuries, this group of codes includes poisonings and impairments caused by accidents or nonaccidental violence. Unless otherwise specified, the term injury is used to cover all of these.

A person may sustain more than one injury in a single accident (for instance, a broken leg and laceration of the scalp), so the number of injury conditions may exceed the number of persons injured.

Statistics of acute injury conditions include only injuries that involved medical attendance or at least a half day of restricted activity.

Episodes of persons injured—Each time a person is involved in an accident or nonaccidental violence causing

injury that results in medical attention or at least a half day of restricted activity, it is counted as a separate episode of a person injured. Therefore, one person may account for more than one episode of a person injured.

The number of episodes of persons injured is not equivalent to the number of accidents for several reasons: (a) the term "accident" as commonly used may not involve injury at all; (b) more than one injured person may be involved in a single accident, so the number of accidents resulting in injury would be less than the number of persons injured in accidents; and (c) the term "accident" ordinarily implies an accidental origin, whereas "persons injured" as used in the NHIS includes persons whose injuries resulted from certain nonaccidental violence.

The number of episodes of persons injured in a specified time interval is equal to or less than the incidence of injury conditions because a person may incur more than one injury in a single accident.

Terms relating to accidents

Motor vehicle—A motor vehicle is any mechanically or electrically powered device, not operated on rails, on which or by which a person or property can be transported or drawn on a land highway. Any object being towed by a motor vehicle (such as a trailer, coaster, sled, or wagon) is considered a part of the motor vehicle. Devices used solely for moving persons or materials within the confines of a building and its premises are not counted as motor vehicles.

Moving motor vehicle accident—An accident is classified as "moving motor vehicle" if at least one of the motor vehicles involved in the accident was moving at the time of the accident. This category is divided into "traffic" and "nontraffic" accidents.

Traffic moving motor vehicle accident—An accident is in the "traffic" category if it occurred on a public street or highway. It is considered to have occurred on the highway if it occurred wholly on the highway, originated on the highway, terminated on the highway, or involved a vehicle partially on the highway. (See "street or highway.")

Nontraffic moving motor vehicle accident—The accident is in the "nontraffic" category if it occurred entirely in any place other than a public street or highway.

Street or highway—"Street or highway" means the entire width between property lines of a way or place, any part of which is open for use of the public as matter of right or custom. This includes more than just the traveled part of the road. "Street or highway" includes the whole right-of-way. Public sidewalks are part of the street, but private driveways, private lanes, private alleys, and private sidewalks are *not* considered part of the street.

Nonmoving motor vehicle accident—If the motor vehicle was not moving at the time of the accident, the accident is considered a "nonmoving motor vehicle" accident and is classified in the "other accident" category. (See "other accident.")

Accident while at work—An accident is classified as "while at work" if the injured person was 18 years of age

or over and was at work at a job or business at the time the accident happened.

Home accident—An accident is classified as "home accident" if the injury occurred either inside or outside the house. "Outside the house" refers to the yard, building, and sidewalks on the property. "Home" includes not only the person's own home but also any other home in which the person may have been injured.

Industrial place—This category includes factory buildings, railways yards, warehouses, workshops, loading platforms of factories or stores, construction projects (houses, buildings, bridges, new roads, and the like), as well as buildings undergoing remodeling. However, accidents in private homes undergoing remodeling are classified as home accidents.

Other accident—This category includes injuries in public places (such as tripping and falling in a store or on a public sidewalk) and also nonaccidental injuries such as homicidal and suicidal attempts. The survey does not cover the military population, but current disability of various types resulting from prior injury that occurred while the person was in the armed forces is covered and is included in this class.

Terms relating to physician contacts

Physician contact—A physician contact is defined as consultation with a physician, in person or by telephone, for examination, diagnosis, treatment, or advice. (Physician contacts with hospital inpatients are not included.) The contact is considered to be a physician contact if the service is provided directly by the physician or by a nurse or other person acting under a physician's supervision. For the purpose of this definition, "physician" includes doctors of medicine and osteopathic physicians. The term "doctor" is used in the interview rather than "physician" because of popular usage. However, the concept toward which all instructions are directed is that which is described here.

Physician contacts for services provided on a mass basis are not included in the tabulations. A service received on a mass basis is defined as any service involving only a single test (such as a test for diabetes) or a single procedure (such as a measles inoculation) when this single service is administered identically to all persons who are at the place for this purpose. Hence obtaining a chest x ray in a tuberculosis chest x-ray trailer is not included as a physician contact. However, a special chest x ray given in a physician's office or in an outpatient clinic is considered a physician contact.

If a physician is called to a house to see more than one person, the call is considered a separate physician contact for each person about whom the physician is consulted.

A physician contact is associated with the person about whom the advice is sought, even if that person does not actually see or consult the physician. For example, if a mother consults a physician about one of her children, the physician contact is ascribed to the child.

Place of contact—The place of contact is a classification of the type of place at which a physician contact took place. The definitions of the various categories are as follows:

Telephone. Refers to medically related matters discussed in a telephone call with a physician or physician's assistant. Calls for nonmedically related matters (such as for an appointment) are not included.

Office. Refers to physician offices that are not located in a hospital.

Hospital. Involves three types of places in a hospital: emergency room, clinic, and doctor's office.

Other. Any place not classified into one of the three categories specified above, including clinics and HMO's not located in hospitals.

Interval since last physician contact—The interval since the last physician contact is the length of time prior to the week of interview since a physician was last consulted in person or by telephone for treatment or advice of any type whatever. A physician contact with a hospital inpatient can be counted as the last time a physician was seen even though it is not included in the "physician contact" category.

Terms relating to hospitalization

Hospital—For this survey, a hospital is defined as any institution either (a) named in the listing of hospitals in the current *American Hospital Association Guide to the Health Care Field* or (b) found on the Master Facility Inventory List maintained by the National Center for Health Statistics.

Short-stay hospital—A short-stay hospital is one in which the type of service provided is general; maternity; eye, ear, nose, and throat; children's; or osteopathic; or it may be the hospital department of an institution.

Hospital day—A hospital day is a day on which a person is confined to a hospital. It is counted as a hospital day only if the patient stays overnight. Thus a patient who enters the hospital on Monday afternoon and leaves Wednesday noon is considered to have had two hospital days.

Hospital days during the year—The number of hospital days during the year is the total number for all hospital episodes in the 12-month period prior to the interview week. For the purposes of this estimate, episodes overlapping the beginning or end of the 12-month period are subdivided so that only those days falling within the period are included.

Hospital episode—A hospital episode is any continuous period of stay of 1 night or more in a hospital as an inpatient except the period of stay of a well newborn infant. A hospital episode is recorded for a family member whenever any part of his hospital stay is included in the 12-month period prior to the interview week.

Hospital discharge—A hospital discharge is the completion of any continuous period of stay of 1 night or more in a hospital as an inpatient except the period of stay of a

well newborn infant. A hospital discharge is recorded whenever a present member of the household is reported to have been discharged from a hospital in the 12-month period prior to the interview week. (Estimates were based on discharges that occurred during the 6-month period prior to the interview.)

Length of hospital stay—The length of hospital stay is the duration in days, exclusive of the day of discharge, of a hospital discharge. (See "hospital discharge.")

Average length of stay—The average length of stay per discharged patient is computed by dividing the total number of hospital days for a specified group by the total number of discharges for that group.

Demographic terms

Age—The age recorded for each person is the age at last birthday. Age is recorded in single years and grouped in a variety of distributions depending on the purpose of the table.

Geographic region—For the purpose of classifying the population by geographic area, the States are grouped into four regions. These regions, which correspond to those used by the U.S. Bureau of the Census, are as follows:

Region	States included
Northeast	Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania.
Midwest	Ohio, Illinois, Indiana, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Kansas and Nebraska.
South	Delaware, Maryland, District of Columbia, West Virginia, Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Oklahoma, Arkansas, and Texas.
West	Washington, Oregon, California, Nevada, New Mexico, Arizona, Idaho, Utah, Colorado, Montana, Wyoming, Alaska, and Hawaii.

Place of residence—The place of residence of a member of the civilian noninstitutionalized population is classified as inside a metropolitan statistical area (MSA) or outside an MSA. Place of residence inside an MSA is further classified as either central city or not central city.

Metropolitan statistical area—The definition and titles of MSA's are established by the U.S. Office of Management and Budget with the advice of the Federal Committee on Metropolitan Statistical Areas. Generally speaking, an MSA consists of a county or group of counties containing at least one city (or twin cities) having a population of 50,000 or more plus adjacent counties that are metropolitan in character and are economically and socially

integrated with the central city. In New England, towns and cities rather than counties are the units used in defining MSA's. There is no limit to the number of adjacent counties included in the MSA as long as they are integrated with the central city, nor is an MSA limited to a single State; boundaries may cross State lines. The metropolitan population in this report is based on MSA's as defined in the 1980 census and does not include any subsequent additions or changes.

Central city of an MSA—The largest city in an MSA is always a central city. One or two additional cities may be secondary central cities in the MSA on the basis of either of the following criteria:

1. The additional city or cities must have a population one-third or more of that of the largest city and a minimum population of 25,000.
2. The additional city or cities must have at least 250,000 inhabitants.

Not central city of an MSA—This includes all of the MSA that is not part of the central city itself.

Not in MSA—This includes all other places in the country.

Race—The population is divided into three racial groups: "white," "black," and "all other." "All other" included Aleut, Eskimo or American Indian, Asian, or Pacific Islander, and any other races. Race characterization is based on the respondent's description of his or her racial background.

Income of family or of unrelated individuals—Each member of a family is classified according to the total income of the family of which he or she is a member. Within the household, all persons related to each other by blood, marriage, or adoption constitute a family. Unrelated individuals are classified according to their own incomes.

The income recorded is the total of all income received by members of the family (or by an unrelated individual) in the 12-month period preceding the week of interview. Income from all sources—for example, wages, salaries, rents from property, pensions, government payments, and help from relatives—is included.

Currently employed—Persons 18 years of age and over who reported that at any time during the 2-week period

covered by the interview they either worked at or had a job or business are currently employed. Current employment includes paid work as an employee of someone else; self-employment in business, farming, or professional practice; and unpaid work in a family business or farm. Persons who were temporarily absent from a job or business because of a temporary illness, vacation, strike, or bad weather are considered as currently employed if they expected to work as soon as the particular event causing the absence no longer existed.

Freelance workers are considered currently employed if they had a definite arrangement with one employer or more to work for pay according to a weekly or monthly schedule, either full time or part time.

Excluded from the currently employed population are persons who have no definite employment schedule but work only when their services are needed. Also excluded from the currently employed population are (a) persons receiving revenue from an enterprise but not participating in its operation, (b) persons doing housework or charity work for which they received no pay, (c) seasonal workers during the portion of the year they were not working, and (d) persons who were not working, even though having a job or business, but were on layoff and looking for work.

The number of currently employed persons estimated from the NHIS will differ from the estimates prepared from the Current Population Survey (CPS) of the U.S. Bureau of the Census for several reasons. In addition to sampling variability they include three primary conceptual differences, namely:

1. NHIS estimates are for persons 18 years of age and over; CPS estimates are for persons 16 years of age and over.
2. NHIS uses a 2-week reference period, while CPS uses a 1-week reference period.
3. NHIS is a continuing survey with separate samples taken weekly; CPS is a monthly sample taken for the survey week which includes the 12th of the month.

The most detailed operational definitions of all of these terms are found in the *NHIS Interviewer's Manual* (16). Instructions are given in the manual on how problem cases associated with each concept are to be handled.

NATIONAL HEALTH INTERVIEW SURVEY

6a. What is your exact address? (Include House No., Apt. No., or other identification, county and ZIP Code)

City _____ State _____ County _____ ZIP Code _____

b. Is this your mailing address? (Mark box or specify if different. Include county and ZIP Code.)

City _____ State _____ County _____ ZIP Code _____ Same as 6a ☐

c. Special place name _____ Sample unit number _____ Type code _____

AREA AND BLOCK SEGMENTS

7. YEAR BUILT
☐ Ask ☐ Do not ask

When was this structure originally built?
Before 4-1-80 (Continue interview) ☐
After 4-1-80 (Complete item 8c when required, end interview) ☐

8. COVERAGE QUESTIONS
☐ Ask items that are marked ☐ Do not ask

a. Are there any occupied or vacant living quarters besides your own in this building? Yes (Fill Table A) ☐ No ☐

b. Are there any occupied or vacant living quarters besides your own on this floor? Yes (Fill Table A) ☐ No ☐

c. Is there any other building on this property for people to live in, either occupied or vacant? Yes (Fill Table A) ☐ No ☐

9a. LAND USE

☐ URBAN (101)
☐ RURAL

Reg. units and SP PL units coded BS-88 in 6c. Ask item 9b.
SP PL units not coded BS-88 in 6c. Mark "No" in item 9b without asking.

b. During the past 12 months did sales of crops, livestock, and other farm products from this place amount to \$1,000 or more?
Yes ☐ No ☐ (101)

10. CLASSIFICATION OF LIVING QUARTERS -- Mark by observation

a. LOCATION of unit
Unit is:
In a Special Place Refer to Table A in Part C of manual; then complete 10c or d
NOT in a Special Place 10b1

b. Access
Direct (10c)
Through another unit Not a separate HU combine with unit through which access is gained (Apply merged unit procedures if additional living quarters space was listed separately)

c. HOUSING unit (Mark one THEN page 2)
01 House/apartment flat
02 HU in nontransient hotel/motel/etc.
03 HU permanent in transient hotel/motel/etc.
04 HU in rooming house
05 Mobile home or trailer with no permanent room added
06 Mobile home or trailer with one or more permanent rooms added
07 HU not specified above Describe in footnotes

d. OTHER unit Mark one
08 Quarters not HU in rooming or boarding house
09 Unit not permanent in transient hotel/motel/etc.
10 Unoccupied site for mobile home/trailer/etc.
11 Student quarters in college dormitory
12 OTHER unit not specified above Describe in footnotes

11. What is the telephone number Area code number here?

None ☐ Yes ☐

12. Interview observed?

Yes ☐ No ☐

13a. Interviewer's name Code

b. Language of interview
English ☐ Born Elsewhere Spanish ☐
Spanish ☐ Other ☐

14. List column numbers of persons requiring callbacks and mark appropriate

Person	Column Number	Require Callback
1	1	<input type="checkbox"/>
2	2	<input type="checkbox"/>

- ☐ All persons 65 and over (5)
- ☐ Other (4)

4a. Are any of the persons in this family now on full-time active duty with the armed forces? ☐ Yes ☐ No (5)

b. Who is this?

Delete column number(s) _____ by an "X" from 1—C2

c. Anyone else?

☐ Yes (Reask 4b and c) ☐ No

Ask for each person in armed forces

d. Where does — usually live and sleep, here or somewhere else?

Mark box in person's column.

4d.

- ☐ Living at home
- ☐ Not living at home

5. We would like to have all adult family members who are at home take part in the interview. Are (names of persons 17 and over) at home now? If "Yes," ask "Could they join us?" (Allow time)

Read to respondent(s).

This survey is being conducted to collect information on the nation's health. I will ask about hospitalizations, disability, visits to doctors, illness in the family, and other health related items.

HOSPITAL PROBE

6a. Since (13-month hospital date) a year ago, was — a patient in a hospital OVERNIGHT?

6a.	1 <input type="checkbox"/> Yes
	2 <input type="checkbox"/> No (Mark "HOSP" box THEN NP)

b. How many different times did — stay in any hospital overnight or longer since (13-month hospital date) a year ago?

b.	Number of times	(Make entry in "HOSP" box THEN NP)
----	-----------------	------------------------------------

Ask for each child under one:

7a. Was — born in a hospital?

7a.	1 <input type="checkbox"/> Yes
	2 <input type="checkbox"/> No (NP)

Ask for mother and child

b. Have you included this hospitalization in the number you gave me for —?

b.	<input type="checkbox"/> Yes (NP)
	<input type="checkbox"/> No (Correct 6 and "HOSP" box)

Hand calendar.

(The next questions refer to the 2 weeks outlined in red on that calendar, beginning Monday, (date) and ending this past Sunday (date).)

D1

Refer to age

☐ Under 5 (4) ☐ 5-17 (3) ☐ 18 and over (1)

1a. DURING THOSE 2 WEEKS, did — work at any time at a job or business not counting work around the house? (Include unpaid work in the family [farm/business].)

1 ☐ Yes (Mark "Wa" box, THEN 2) 2 ☐ No

b. Even though — did not work during those 2 weeks, did — have a job or business?

1 ☐ Yes (Mark "Wb" box, THEN 2) 2 ☐ No (4)

2a. During those 2 weeks, did — miss any time from a job or business because of illness or injury?

☐ Yes ☐ No (4)

b. During that 2-week period, how many days did — miss more than half of the day from — job or business because of illness or injury?

☐ None (4) (4)

3a. During those 2 weeks, did — miss any time from school because of illness or injury?

☐ Yes ☐ No (4)

b. During that 2-week period, how many days did — miss more than half of the day from school because of illness or injury?

☐ None

4a. During those 2 weeks, did — stay in bed because of illness or injury?

☐ Yes ☐ No (6)

b. During that 2-week period, how many days did — stay in bed more than half of the day because of illness or injury?

☐ None (6) (D2)

D2

Refer to 2b and 3b.

☐ No days in 2b or 3b (6)
☐ 1 or more days in 2b or 3b (5)

5. On how many of the (number in 2b or 3b) days missed from (work/school) did — stay in bed more than half of the day because of illness or injury?

☐ None

Refer to 2b, 3b, and 4b.

6a. (Not counting the day(s) [missed from work missed from school (end) in bed],

Was there any (OTHER) time during those 2 weeks that — cut down on the things — usually does because of illness or injury?

☐ Yes ☐ No (D3)

b. (Again, not counting the day(s) [missed from work missed from school (end) in bed],

During that period, how many (OTHER) days did — cut down for more than half of the day because of illness or injury?

☐ None

D3

Refer to 2-6.

☐ No days in 2-6 (Mark "No" in RD, THEN NP)
☐ 1 or more days in 2-6 (Mark "Yes" in RD, THEN 7)

Refer to 2b, 3b, 4b, and 6b

7a. What (other) condition caused — to [miss work miss school (or) stay in bed (or) cut down] during those 2 weeks?

(Enter condition in C2, THEN 7b)

b. Did any other condition cause — to [miss work miss school (or) stay in bed (or) cut down] during that period?

1 ☐ Yes (Reask 7a and b) 2 ☐ No

CONDITION 1

PERSON NO. _____

1. Name of condition

Mark "2 wk ref. pd" box without asking if "DV" or "HS" in C2 as source

2. When did (— / anyone) last see or talk to a doctor or assistant about — (condition)?

- 0 ☐ Interview week (Reask 2)
- 1 ☐ 2 wk ref. pd
- 2 ☐ Over 2 weeks, less than 6 mos
- 3 ☐ 6 mos., less than 1 yr
- 4 ☐ 1 yr., less than 2 yrs
- 5 ☐ 2 yrs., less than 5 yrs
- 6 ☐ 5 yrs. or more
- 7 ☐ Dr. seen, OK when
- 8 ☐ OK if Dr. seen } (3b)
- 9 ☐ Or never seen }

3a. (Earlier you told me about — (condition)) Did the doctor or assistant call the (condition) by a more technical or specific name?

- 1 ☐ Yes 2 ☐ No 3 ☐ DK

Ask 3b if "Yes" in 3a, otherwise transcribe condition name from item 1 without asking

b. What did he or she call it?

- (Specify)
- 1 ☐ Color Blindness (NC)
- 2 ☐ Cancer (3e)
- 3 ☐ Normal pregnancy, normal delivery, vesectomy } (5)
- 4 ☐ Old age (NC)
- 5 ☐ Other (3c)

c. What was the cause of — (condition in 3b)? (Specify)

Mark box if accident or injury. 0 ☐ Accident/injury (5)

d. Did the (condition in 3b) result from an accident or injury?

- 1 ☐ Yes (5) 2 ☐ No

Ask 3e if the condition name in 3b includes any of the following words

Allment	Cancer	Disease	Problem
Anemia	Condition	Disorder	Rupture
Asthma	Cyst	Growth	Trouble
Attack	Defect	Masses	Tumor
Bad			Ulcer

e. What kind of (condition in 3b) is it? (Specify)

Ask 3f only if allergy or stroke in 3b—e

f. How does the [allergy/stroke] NOW effect — ? (Specify)

For Stroke, fill remainder of this condition page for the first present effect. Enter in item C2 and complete a separate condition page for each additional present effect.

Ask 3g if there is an impairment (refer to C, first, P2) or any of the following entries in 3b—f

Abcess	Damage	Palsy
Ache (except head or ear)	Growth	Paralysis
Bleeding (except menstrual)	Hemorrhage	Rupture
Blood clot	Infection	Soreness
Bolt	Inflammation	Stiffness
Cancer	Neuralgia	Tumor
Cramps (except menstrual)	Neuritis	Ulcer
Cyst	Pain	Varicose veins
		Weakness

g. What part of the body is affected?

(Specify)

Show the following detail

Head	skull, scalp, face
Back/spine/vertebrae	upper, middle, lower
Side	left or right
Ear	inner or outer; left, right, or both
Eye	left, right, or both
Arm	shoulder, upper, elbow, lower or wrist; left, right, or both
Hand	entire hand or fingers only; left, right, or both
Leg	hip, upper, knee, lower, or ankle; left, right, or both
Foot	entire foot, arch, or toes only; left, right, or both

Except for eyes, ears, or internal organs, ask 3h if there are any of the following entries in 3b—f

Infection	Bore	Soreness
-----------	------	----------

h. What part of the (part of body in 3b—g) is affected by the [infection/sore/soreness] — the skin, muscle, bone, or some other part?

(Specify)

Ask if there are any of the following entries in 3b—f

Tumor	Cyst	Growth
-------	------	--------

4. Is this [tumor/cyst/growth] malignant or benign?

- 1 ☐ Malignant 2 ☐ Benign 3 ☐ DK

5. a. When was — (condition in 3b/3f) first noticed?

- 1 ☐ 2 wk ref. pd
- 2 ☐ Over 2 weeks to 3 months
- 3 ☐ Over 3 months to 1 year
- 4 ☐ Over 1 year to 5 years
- 5 ☐ Over 5 years

b. When did — (name of injury in 3b)?

Ask probes as necessary

(Was it on or since (first date of 2-week ref. period) or was it before that date?)

(Was it less than 3 months or more than 3 months ago?)

(Was it less than 1 year or more than 1 year ago?)

(Was it less than 5 years or more than 5 years ago?)

<p>K1 Refer to RD and C2 1 <input type="checkbox"/> "Yes" in "RD" box AND more than 1 condition in C2 (6) 8 <input type="checkbox"/> Other (K2)</p> <p>6a. During the 2 weeks outlined in red on that calendar, did — (condition) cause — to cut down on the things — usually does? <input type="checkbox"/> Yes <input type="checkbox"/> No (K2)</p> <p>b. During that period, how many days did — cut down for more than half of the day? 00 <input type="checkbox"/> None (K2) _____ Days</p> <p>7. During those 2 weeks, how many days did — stay in bed for more than half of the day because of this condition? 00 <input type="checkbox"/> None _____ Days</p> <p>Ask if "Wa/Wb" box marked in C1.</p> <p>8. During those 2 weeks, how many days did — miss more than half of the day from — job or business because of this condition? 00 <input type="checkbox"/> None _____ Days</p> <p>Ask if age 5 — 17.</p> <p>9. During those 2 weeks, how many days did — miss more than half of the day from school because of this condition? 00 <input type="checkbox"/> None _____ Days</p> <p>K2 <input type="checkbox"/> Condition has "CL LTR" in C2 as source (10) <input type="checkbox"/> Condition does not have "CL LTR" in C2 as source (K4)</p> <p>10. About how many days since (12-month date) a year ago, has this condition kept — in bed more than half of the day? (Include days while an overnight patient in a hospital.) 000 <input type="checkbox"/> None _____ Days</p> <p>11. Was — ever hospitalized for — (condition in 3b)? 1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No</p> <p>K3 <input type="checkbox"/> Missing extremity or organ (K4) <input type="checkbox"/> Other (12)</p> <p>12a. Does — still have this condition? 1 <input type="checkbox"/> Yes (K4) <input type="checkbox"/> No</p> <p>b. Is this condition completely cured or is it under control? 2 <input type="checkbox"/> Cured 8 <input type="checkbox"/> Other (Specify) _____ (K4) 3 <input type="checkbox"/> Under control (K4)</p> <p>c. About how long did — have this condition before it was cured? 000 <input type="checkbox"/> Less than 1 month OR _____ Number { 1 <input type="checkbox"/> Months 2 <input type="checkbox"/> Years</p> <p>d. Was this condition present at any time during the past 12 months? 1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No</p> <p>K4 0 <input type="checkbox"/> Not an accident/injury (NC) 1 <input type="checkbox"/> First accident/injury for this person (14) 8 <input type="checkbox"/> Other (13)</p>	<p>13. Is this (condition in 3b) the result of the same accident you already told me about? <input type="checkbox"/> Yes (Record condition page number where accident questions first completed) → _____ (NC) <input type="checkbox"/> No</p> <p>14. Where did the accident happen? 1 <input type="checkbox"/> At home (inside house) 2 <input type="checkbox"/> At home (adjacent premises) 3 <input type="checkbox"/> Street and highway (includes roadway and public sidewalk) 4 <input type="checkbox"/> Farm 5 <input type="checkbox"/> Industrial place (includes premises) 6 <input type="checkbox"/> School (includes premises) 7 <input type="checkbox"/> Place of recreation and sports, except at school 8 <input type="checkbox"/> Other (Specify) _____</p> <p>Mark box if under 18. <input type="checkbox"/> Under 18 (16)</p> <p>15a. Was — under 18 when the accident happened? 1 <input type="checkbox"/> Yes (16) <input type="checkbox"/> No</p> <p>b. Was — in the Armed Forces when the accident happened? 2 <input type="checkbox"/> Yes (16) <input type="checkbox"/> No</p> <p>c. Mark box if under 14. If "Married" refer to household composition and mark accordingly.

7. Is — now married, widowed, divorced, separated, or has — never been married?

7. ☐ Under 14
☐ Married — spouse not in household
☐ Married — spouse not in household
☐ Divorced
☐ Separated
☐ Never married

8a. Was the total combined FAMILY income during the past 12 months — that is, yours, (read names, including Armed Forces members living at home) more or less than \$20,000? Include money from jobs, social security, retirement income, unemployment payments, public assistance, and so forth. Also include income from interest, dividends, net income from business, farm, or rent, and any other money income received.

Read if necessary. Income is important in analyzing the health information we collect. For example, this information helps us to learn whether persons in one income group use certain types of medical care services or have certain conditions more or less often than those in another group.

Read parenthetical phrase if Armed Forces member living at home or if necessary.

b. Of those income groups, which letter best represents the total combined FAMILY income during the past 12 months (that is, yours, (read names, including Armed Forces members living at home))?

Read if necessary. Income is important in analyzing the health information we collect. For example, this information helps us to learn whether persons in one income group use certain types of medical care services or have certain conditions more or less often than those in another group.

These next questions are about foot problems.

1a. DURING THE PAST 12 MONTHS, (that is, since 12 month date a year ago) did anyone in the family have TROUBLE with —

If "Yes," ask 1b and c.

b. Who is this?

Mark box in appropriate person's column.

c. DURING THE PAST 12 MONTHS, did anyone else have TROUBLE with —

A. Ingrown toenails or other toenail problems?

1 ☐ Yes

2 ☐ No

5

B. Foot infection, including athlete's foot, other fungal infections, and warts?

1 ☐ Yes

2 ☐ No

6

C. Corns or calluses?

1 ☐ Yes

2 ☐ No

7

D. Flat feet or fallen arches?

1 ☐ Yes

2 ☐ No

8

E. Clubfoot?

1 ☐ Yes

2 ☐ No

9

DURING THE PAST 12 MONTHS, did anyone in the family have TROUBLE with —

10

F. Deformities of the toe or joint including hammer toe, claw toe, and missing toes?

1 ☐ Yes

2 ☐ No

11

G. Bunions?

1 ☐ Yes

2 ☐ No

12

H. An injury, such as a sprain, strain, fracture or dislocation of the foot?

1 ☐ Yes

2 ☐ No

13

I. Arthritis of the toes?

1 ☐ Yes

2 ☐ No

14

J. Any (other) foot problem? (Specify)

1 ☐ Yes

2 ☐ No

15

Probe: What is the foot problem called?

A. ☐ Toenail problem

5

B. ☐ Foot infection

6

C. ☐ Corns calluses

7

D. ☐ Flat feet fallen arches

8

E. ☐ Clubfoot

9

F. ☐ Toe joint deformity

10

G. ☐ Bunions

11

H. ☐ Injury

12

I. ☐ Arthritis

Section BB — INCOME

The next questions are about health insurance coverage and the kinds and amounts of income that people receive.

Read if necessary. The answers to these questions will add greatly to our knowledge about the health problems of the American people, the types of health care they receive, and whether they can afford the care that they need. The information will help in planning health care services and finding ways to lower costs of care.

There are several government programs which provide medical care or help pay medical bills.

People covered by Medicare have a card that looks like this. *Show Medicare Card*

1a. In (month), was anyone in the family covered by Medicare?

Read if necessary. Medicare is a health insurance program for persons 65 or over and certain disabled persons.

b. Who was this?

Mark "Medicare" box in person's column

c. Anyone else?

☐ Yes (Reask 1b and c)

No

1a.

b.

2a. (In (month), was anyone in the family covered by) Medicaid or (local name)?

Read if necessary. Medicaid or (local name) is a public assistance program that pays for medical care.

b. Who was this?

Mark "Medicaid" box in person's column

c. Anyone else?

☐ Yes (Reask 2b and c)

No

2a.

b.

3a. (In (month), was anyone in the family covered by) CHAMPUS, CHAMPVA, the VA, or military health care?

Read if necessary. These programs cover active duty and retired career military personnel and their dependents and survivors and also disabled veterans and their dependents and survivors.

b. Who was this?

Mark "CHAMPUS" box in person's column

c. Anyone else?

☐ Yes (Reask 3b and c)

No

3a.

b.

4a. Health insurance can also be obtained privately or through a current or former employer or union. Was anyone in the family covered by private health insurance or by membership in a health maintenance organization in (month)?

b. Who was this?

Mark "HI Plan" box in person's column

c. Anyone else?

☐ Yes (Reask 4b and c)

No

Ask 4d for each person with "HI Plan" marked in 4b

d. Was any of — health insurance obtained through an employer or union?

4a.

b.

d.

Section Q — GENERAL HEALTH HABITS

Sample Person Number _____

**ITEM
Q1**

- 1 ☐ Available (1)
2 ☐ Callback required (Hhld. page)
3 ☐ Noninterview (Cover page)

7805

These next questions are about general health practices.

1. How often do you eat breakfast — almost every day, sometimes, rarely or never?

- 1 ☐ Almost every day
2 ☐ Sometimes
3 ☐ Rarely or never

7808

2. Including evening snacks, how often do you eat between meals — almost every day, sometimes, rarely or never?

- 1 ☐ Almost every day
2 ☐ Sometimes
3 ☐ Rarely or never

7807

3. When you visit a doctor or other health professional for routine care, is eating proper foods discussed often, sometimes, rarely or never?

- 1 ☐ Often
2 ☐ Sometimes
3 ☐ Rarely or never
4 ☐ Don't visit for routine care

7808

4a. About how tall are you without shoes?

_____ Feet _____ Inches

7809

b. About how much do you weigh without shoes?

_____ Pounds

7812

Hand Card Q1. Read categories if telephone interview.

5. In your opinion which of these are the TWO best ways to lose weight?

- 1 ☐ Don't eat at bedtime
2 ☐ Eat fewer calories
3 ☐ Take diet pills
4 ☐ Increase physical activity
5 ☐ Eat NO fat
6 ☐ Eat grapefruit with each meal
9 ☐ DK
0 ☐ None of these

7815

6. Are you now trying to lose weight?

- 1 ☐ Yes
2 ☐ No (9)

7817

7. Are you eating fewer calories to lose weight?

- 1 ☐ Yes
2 ☐ No

7818

8. Have you increased your physical activity to lose weight?

- 1 ☐ Yes
2 ☐ No

7819

9a. Do you consider yourself overweight, underweight, or just about right?

- 1 ☐ Overweight
2 ☐ Underweight
3 ☐ About right } (10)

7820

b. Would you say you are very overweight, somewhat overweight, or only a little overweight?

- 1 ☐ Very overweight
2 ☐ Somewhat overweight
3 ☐ Only a little overweight

7821

10. On the average, how many hours of sleep do you get in a 24-hour period?

_____ Hours

7822

c. About how many times a year do you examine your own breasts for lumps?	____ Times per year 000 <input type="checkbox"/> Never/Less than once a year 999 <input type="checkbox"/> DK	7834

Notes

Section R – MAMMOGRAPHY

ITEM R1

Refer to age.

- ☐ Female 35 or over (1)
☐ Other (Section S)

1a. A mammogram is an X-ray taken only of the breasts by a machine that presses against the breast while the picture is taken.
 Have you ever had a mammogram?

- 1 ☐ Yes
 2 ☐ No (4)
 9 ☐ DK (5)

7906

b. How many times have you had a mammogram?

_____ Times

7907

2. (Please think about your FIRST mammogram) Did a doctor or other health professional suggest that you have this (first) mammogram or did you decide this on your own?

- 1 ☐ Doctor or other health professional suggested
 2 ☐ Decided on own
 8 ☐ Other — Specify _____
 9 ☐ DK

7909

3a. When did you have your (most recent) mammogram?

- _____ } ☐ Days ago
 _____ } ☐ Weeks ago
 _____ } ☐ Months ago
 _____ } ☐ Years ago
 9 ☐ DK

7910

b. Was your (most recent) mammogram done because of some breast symptom or condition, or as a routine checkup?

- 1 ☐ Breast symptom or condition
 2 ☐ Routine checkup, no symptoms
 3 ☐ Family history of breast cancer
 8 ☐ Other reason — Specify _____
 9 ☐ DK/Don't remember

7913

ITEM R2

Refer to question 3a.

- ☐ More than 3 years in 3a (4)
☐ Other (5)

4. What is the most important reason why you have [never had a mammogram/not had a mammogram in the past few years]?
 Mark only one.

- 01 ☐ Not recommended by doctor or doctor never said it was needed
 02 ☐ Didn't think necessary or needed
 03 ☐ No problems
 04 ☐ Put it off; procrastinated
 05 ☐ Didn't know I should
 06 ☐ Cost too much or insurance doesn't cover it
 07 ☐ Fear (of radiation, pain; or of results)

Which, if any, of these conditions do you believe can be caused by radon exposure? <i>Mark all that apply.</i>	1 <input type="checkbox"/> Headache 2 <input type="checkbox"/> Arthritis 3 <input type="checkbox"/> Lung cancer 4 <input type="checkbox"/> Other cancer 5 <input type="checkbox"/> Asthma 6 <input type="checkbox"/> None of these 9 <input type="checkbox"/> DK	8307
4. Has your household air been tested for the presence of radon?	1 <input type="checkbox"/> Yes (6) 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK	8314
5. Do you or anyone plan to have this home tested for radon within the next year?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK } (10)	8315
6. Were followup tests conducted to verify the results of the first test?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK	8316
7a. Has anything been done in this home to reduce the radon level or to reduce the radon exposure?	1 <input type="checkbox"/> Yes (7c) 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK	8317
b. Do you or anyone plan to do anything to reduce the radon level or radon exposure in this home?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK } (8)	8318
c. What has been done? Anything else? <i>Mark all that apply.</i>	<input type="checkbox"/> Increase ventilation by opening windows, doors, etc. <input type="checkbox"/> Stopped or decreased smoking <input type="checkbox"/> Moved out of or spend less time in basement <input type="checkbox"/> Modified home — sealed cracks, installed ventilation system, etc. <input type="checkbox"/> Other — Specify — <input type="checkbox"/> DK	8319
8a. What was the radon level from that (last) test (BEFORE any corrective action was taken)?	_____. Picocuries per liter (9) 9996 <input type="checkbox"/> DK results yet (10) 9999 <input type="checkbox"/> DK level (8b)	8325
b. Was it above or below 4 picocuries (pi'-ko-kurees) per liter?	1 <input type="checkbox"/> Above 4 2 <input type="checkbox"/> At or below 4 9 <input type="checkbox"/> DK (10)	8329
9. How harmful to health is this radon level — would you say not harmful, somewhat harmful, very harmful, or do you not know?	1 <input type="checkbox"/> Not harmful 2 <input type="checkbox"/> Somewhat harmful 3 <input type="checkbox"/> Very harmful 9 <input type="checkbox"/> DK	8330
<i>Mark box or ask:</i> 10. Which of the following best describes your residence? <i>Read answer categories.</i>	1 <input type="checkbox"/> Single home, duplex, townhouse 2 <input type="checkbox"/> Basement, first or second floor apartment or condominium 3 <input type="checkbox"/> Apartment or condominium above second floor 4 <input type="checkbox"/> Trailer/mobile home 8 <input type="checkbox"/> Other — Specify — 	8331
Notes		

Section U — CARDIOVASCULAR DISEASE

1. I am going to read a list of things which may or may not affect a person's chances of getting HEART DISEASE.

Hand Card U1. Repeat answer categories if telephone interview.

After I read each one, tell me if you think it definitely increases, probably increases, probably does not, or definitely does not increase a person's chances of getting heart disease. First —

DEFINITELY INCREASES PROBABLY INCREASES PROBABLY DOES NOT INCREASE DEFINITELY DOES NOT INCREASE DK/NO OPINION

a. Cigarette smoking? (Give me a number from the card.)

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8405**

b. High blood pressure?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8406**

c. Diabetes?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8407**

d. Being VERY overweight?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8408**

e. Eating a diet high in animal fat?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8409**

f. Family history of heart disease?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8410**

g. High cholesterol?

1 ☐ 2 ☐ 3 ☐ 4 ☐ 9 ☐ **8411**

8412

2. The following conditions are related to having a STROKE. In your opinion, which of these conditions MOST increases a person's chances of having a stroke — diabetes, high blood pressure, or high cholesterol?

1 ☐ Diabetes
2 ☐ High blood pressure
3 ☐ High cholesterol
9 ☐ DK

Hand card U2. Repeat answer categories if telephone interview.

3. For each of the following, tell me if you think it is strongly associated with high blood pressure, somewhat associated with high blood pressure, or probably not at all associated with high blood pressure.

STRONGLY ASSOCIATED SOMEWHAT ASSOCIATED PROBABLY NOT AT ALL ASSOCIATED DK/NO OPINION

a. Sodium or salt?

1 ☐ 2 ☐ 3 ☐ 9 ☐ **8413**

b. Alcohol?

1 ☐ 2 ☐ 3 ☐ 9 ☐ **8414**

c. Cholesterol?

1 ☐ 2 ☐ 3 ☐ 9 ☐ **8415**

8416

4. Have you EVER been told by a doctor or other health professional that you had hypertension, sometimes called high blood pressure?

1 ☐ Yes
2 ☐ No (12)
3 ☐ Only during pregnancy (12)

5. Were you told two or more DIFFERENT times that you had high blood pressure?

1 ☐ Yes
2 ☐ No
9 ☐ DK

8417

6. Are you NOW taking any medicine prescribed by a doctor for your high blood pressure?

1 ☐ Yes (8)
2 ☐ No

8418

7a. Was any medicine EVER prescribed by a doctor for your high blood pressure?

1 ☐ Yes
2 ☐ No (8)

8419

b. Did a doctor advise you to stop taking the medicine?

1 ☐ Yes
2 ☐ No

8420

Notes

Section U — CARDIOVASCULAR DISEASE — Continued

8. Because of your high blood pressure, has a doctor or other health professional EVER advised you to —	a. Diet to lose weight? 1 <input type="checkbox"/> Yes (9) 8421 2 <input type="checkbox"/> No (8b)	b. Cut down on salt or sodium in your diet? 1 <input type="checkbox"/> Yes (9) 8424 2 <input type="checkbox"/> No (8c)	c. Exercise? 1 <input type="checkbox"/> Yes (9) 8427 2 <input type="checkbox"/> No (8d)	d. Cut down on alcohol use? 1 <input type="checkbox"/> Yes (9) 8430 2 <input type="checkbox"/> No (11)
9. Have you EVER followed this advice?	1 <input type="checkbox"/> Yes (10) 8422 2 <input type="checkbox"/> No (8b)	1 <input type="checkbox"/> Yes (10) 8425 2 <input type="checkbox"/> No (8c)	1 <input type="checkbox"/> Yes (10) 8428 2 <input type="checkbox"/> No (8d)	1 <input type="checkbox"/> Yes (10) 8431 2 <input type="checkbox"/> No (11)
10. Are you NOW following this advice?	1 <input type="checkbox"/> Yes } (8b) 8423 2 <input type="checkbox"/> No }	1 <input type="checkbox"/> Yes } (8c) 8426 2 <input type="checkbox"/> No }	1 <input type="checkbox"/> Yes } (8d) 8429 2 <input type="checkbox"/> No }	1 <input type="checkbox"/> Yes } (11) 8432 2 <input type="checkbox"/> No }
11a. Do you still have high blood pressure?		1 <input type="checkbox"/> Yes (12) 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK 8433		
b. Is this condition completely cured or is it under control?		1 <input type="checkbox"/> Cured 2 <input type="checkbox"/> Under control 9 <input type="checkbox"/> DK 8434		
12a. ABOUT how long has it been since you LAST had your blood pressure taken by a doctor or other health professional?		<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> Number _____ </div> <div style="font-size: 3em; margin-right: 10px;">{</div> <div> <input type="checkbox"/> Days <input type="checkbox"/> Weeks <input type="checkbox"/> Months <input type="checkbox"/> Years </div> </div> <div style="margin-top: 10px;"> <input type="checkbox"/> Never 9 <input type="checkbox"/> DK 8435 </div>		
b. Blood pressure is usually given as one number over another. Were you told what your blood pressure was, in NUMBERS?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 9 <input type="checkbox"/> DK 8438		
c. At that time, was your blood pressure high, low, or normal?		1 <input type="checkbox"/> High 2 <input type="checkbox"/> Low 3 <input type="checkbox"/> Normal 8 <input type="checkbox"/> Other (Specify) _____ 9 <input type="checkbox"/> DK 8439		
13. Do you NOW have diabetes or sugar diabetes?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 3 <input type="checkbox"/> Other 9 <input type="checkbox"/> DK 8440		
14. Do you have any kind of heart condition or heart trouble?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 8441		
15. Have you ever had a stroke?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 8442		
16. Have you ever made any lasting changes in the types of foods you eat in order to lower your blood cholesterol?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 8443		
17. Have you ever had your blood cholesterol level checked?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No (Section V) 8444		
18. Have you ever been told by a doctor or other health professional that your blood cholesterol level was high?		1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 8445		
Notes				

Section V — STRESS

<p>These next questions are about stress.</p> <p>1a. During the past 2 weeks, would you say that you experienced a lot of stress, a moderate amount of stress, relatively little stress, or almost no stress at all?</p>		<p>1 <input type="checkbox"/> A lot</p> <p>2 <input type="checkbox"/> Moderate</p> <p>3 <input type="checkbox"/> Relatively little</p> <p>4 <input type="checkbox"/> Almost none</p> <p>5 <input type="checkbox"/> DK what stress is (Section W)</p> <p>9 <input type="checkbox"/> DK</p>	8505																																																												
<p>b. During the past YEAR, would you say that you experienced a lot of stress, a moderate amount of stress, relatively little stress, or almost no stress at all?</p>		<p>1 <input type="checkbox"/> A lot</p> <p>2 <input type="checkbox"/> Moderate</p> <p>3 <input type="checkbox"/> Relatively little</p> <p>4 <input type="checkbox"/> Almost none</p> <p>9 <input type="checkbox"/> DK</p>	8508																																																												
<p>2. In the past YEAR, how much effect has stress had on your health — a lot, some, hardly any, or none?</p>		<p>1 <input type="checkbox"/> A lot</p> <p>2 <input type="checkbox"/> Some</p> <p>3 <input type="checkbox"/> Hardly any or none</p>	8507																																																												
<p>3a. In the past year, did you think about seeking help for any personal or emotional problems from family or friends?</p>		<p>1 <input type="checkbox"/> Yes</p> <p>2 <input type="checkbox"/> No</p> <p>9 <input type="checkbox"/> DK</p>	8508

Notes

Section W — EXERCISE — Continued

NOTE — ASK ALL OF 2a BEFORE GOING TO 2b—d.

NOTE: ASK 2b—d FOR EACH ACTIVITY MARKED "YES" IN 2a.

These next questions are about physical exercise. Hand calendar.

2a. In the past 2 weeks (outlined on that calendar), beginning Monday, (date), end ending this past Sunday, (date), have you done any (of the following exercises, sports, or physically active hobbies) —

YES NO

8807

(1) Walking for exercise?

1 ☐ 2 ☐

b. How many times in the past 2 weeks did you [play/go/do] (activity in 2a)?

(1) _____ Times

8608

c. On the average, about how many minutes did you actually spend (activity in 2a) on each occasion?

_____ Minutes

8810

d. (What usually happened to your heart rate or breathing when you (activity in 2a)? Did you have a small, moderate, or large increase, or no increase at all in your heart rate or breathing?

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8813

ITEM W2

Refer to age. 1 ☐ SP is 75+ (23)
8 ☐ Other (2)

(2) Jogging or running?

1 ☐ 2 ☐

(2) _____ Times

8816

_____ Minutes

8816

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8821

(3) Hiking?

1 ☐ 2 ☐

(3) _____ Times

8823

_____ Minutes

8825

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8828

(4) Gardening or yard work?

1 ☐ 2 ☐

(4) _____ Times

8830

_____ Minutes

8832

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8835

(5) Aerobics or aerobic dancing?

1 ☐ 2 ☐

(5) _____ Times

8837

_____ Minutes

8839

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8842

(6) Other dancing?

1 ☐ 2 ☐

(6) _____ Times

8844

_____ Minutes

8848

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8849

(7) Calisthenics or general exercise?

1 ☐ 2 ☐

(7) _____ Times

8861

_____ Minutes

8853

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8858

(8) Golf?

1 ☐ 2 ☐

(8) _____ Times

8858

_____ Minutes

8860

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8883

(9) Tennis?

1 ☐ 2 ☐

(9) _____ Times

8886

_____ Minutes

8887

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8870

(10) Bowling?

1 ☐ 2 ☐

(10) _____ Times

8872

_____ Minutes

8874

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8877

(11) Biking?

1 ☐ 2 ☐

(11) _____ Times

8879

_____ Minutes

8881

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8884

(12) Swimming or water exercises?

1 ☐ 2 ☐

(12) _____ Times

8886

_____ Minutes

8888

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8891

(13) Yoga?

1 ☐ 2 ☐

(13) _____ Times

8893

_____ Minutes

8895

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8898

ITEM W3

Refer to age. 1 ☐ SP is 65—74 (23)
8 ☐ Other (14)

(14) Weight lifting or training?

1 ☐ 2 ☐

(14) _____ Times

8707

_____ Minutes

8709

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8712

(15) Basketball?

1 ☐ 2 ☐

(15) _____ Times

8714

_____ Minutes

8718

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8719

(16) Baseball or softball?

1 ☐ 2 ☐

(16) _____ Times

8721

_____ Minutes

8723

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8726

(17) Football?

1 ☐ 2 ☐

(17) _____ Times

8728

_____ Minutes

8730

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8733

(18) Soccer?

1 ☐ 2 ☐

(18) _____ Times

8736

_____ Minutes

8737

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8740

(19) Volleyball?

1 ☐ 2 ☐

(19) _____ Times

8742

_____ Minutes

8744

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8747

(20) Handball, racquetball, or squash?

1 ☐ 2 ☐

(20) _____ Times

8749

_____ Minutes

8751

1 ☐ Small
2 ☐ Moderate

3 ☐ Large
4 ☐ None

8754

(21) Skating?

1 ☐ 2 ☐

(21) _____ Times

8758

_____ Minutes

8758

1 ☐ Small
2 ☐ Moderate

7a. If a woman takes birth control pills, is she more likely to have a stroke if she smokes than if she does not smoke?

- 1 ☐ Yes
2 ☐ No
9 ☐ DK } (X4)

b. Is she much more likely or somewhat more likely to have a stroke?

- 1 ☐ Much more
2 ☐ Somewhat more

ITEM X4

Refer to 1 on page 37.

- ☐ "Yes" in 1 (8)
☐ Other (Section Y)

8. Did a doctor EVER advise you to quit or cut down on smoking?

- 1 ☐ Yes
2 ☐ No
9 ☐ DK

Notes

Section Y – ALCOHOL USE

These next questions are about drinking alcoholic beverages. Included are liquor such as whiskey, rum, gin, or vodka, and beer, and wine, and any other type of alcoholic beverage.

8905

1a. In YOUR ENTIRE LIFE have you had at least 12 drinks of ANY kind of alcoholic beverage?

- 1 ☐ Yes
2 ☐ No (1d)

b. In ANY ONE YEAR have you had at least 12 drinks of ANY kind of alcoholic beverage?

- 1 ☐ Yes
2 ☐ No (1d)

8906

c. Have you had at least one drink of beer, wine, or liquor during the PAST YEAR?

- 1 ☐ Yes (2)
2 ☐ No

8907

d. What is your MAIN reason for not drinking (in the past year)?

- 00 ☐ No need/not necessary
01 ☐ Don't care for/dislike it
02 ☐ Medical/health reasons
03 ☐ Religious/moral reasons
04 ☐ Brought up not to drink
05 ☐ Costs too much
06 ☐ Family member an alcoholic or problem drinker
07 ☐ Infrequent drinker
08 ☐ Recovering alcoholic
98 ☐ Other — Specify _____

(7)

8808

2. In the past 2 WEEKS (outlined on that calendar), beginning Monday (date) and ending this past Sunday (date), on how many days did you drink any alcoholic beverages, such as beer, wine, or liquor?

Use list to probe, if necessary.

- | | | |
|---|--------------------------------|---|
| <input type="checkbox"/> None/Never (4) | <input type="checkbox"/> 6 | <input type="checkbox"/> 11–12 |
| <input type="checkbox"/> 1 | <input type="checkbox"/> 6–7 | <input type="checkbox"/> 12 |

9 ☐ DK 47

b. in the past 12 months?

12. How many times have you donated blood since March 1985?

01 ☐ One time
02 ☐ Two times
03 ☐ Three times
04 ☐ Four times
05 ☐ Five times
06 ☐ Six times
07 ☐ Seven times
08 ☐ Eight times
09 ☐ Nine times
10 ☐ Ten times
11 ☐ Eleven times
12 ☐ Twelve times
13 ☐ More than twelve times
99 ☐ DK 48-49

If "No" or "DK" in 11b, mark box 00 or ask:

13. How many times IN THE PAST 12 MONTHS have you donated blood?

00 ☐ None in past twelve months
01 ☐ One time
02 ☐ Two times
03 ☐ Three times
04 ☐ Four times
05 ☐ Five times
06 ☐ Six times
07 ☐ Seven times
08 ☐ Eight times
09 ☐ Nine times
10 ☐ Ten times
11 ☐ Eleven times
12 ☐ Twelve times
13 ☐ More than twelve times
99 ☐ DK 50-51

14. Have you ever heard of a blood test that can detect the AIDS virus infection?

1 ☐ Yes (15)
2 ☐ No } (33, page 30)
9 ☐ DK } 52

The next questions are about the blood test for the AIDS virus infection. No question will ask what the results are of any tests you may have had.

15. To the best of your knowledge, are blood donations routinely tested for the AIDS virus infection?

1 ☐ Yes (Item AA1)
2 ☐ No } (17)
9 ☐ DK } 53
